INDEX OF CONTENTS.

JANUARY TO JUNE, 1893.

A

Abies Mariesi, 299
Abraxis grossulariata, 393
Abutilons, 301
Acacia, the false, for forage, 170
Aconite and Celery, 362
Adiantum cuneatum for cutting, 292
Africa, South, fruit from, 76
Agricultural Benevolent Institution, 47
Agricultural returns for 1892...257
Allamanda Williamsii, 142
Alocasia Dussii, 658
Amiens, market gardens of, 258
Amorphophallus oncophyllus, 658; A. giganteus, 658
Anemone blanda, 333; the garden, 77
Anthurium Chamberlaini, 259, 719; A. Scherzerianum, 358; effect of manuring, 579
Antibes, hardy Palms in, 132
Antirrhinum glutinosum, 298
Apiary, the, 15, 71, 144, 198, 262, 359, 447, 520, 573, 660, 717
Aposporous Lastrea, an, 549
Apple, Armorel, 268, 301; Atalanta, 293; Beauty of Stoke, 368; Bismarck, 194; Cockle Pippin, 368, 457; crop in South Wilts, 606; decay, interesting, 47; Hormead Pearmain, 203; Jas. Grieve, 53; Reinette du Canada, 521; Royal Somerset, 368; Sturmer Pippin, 457; tree-pests in France, 540
Apples, American and British, 144, 203, 267, 333, 393; and Pears, chemistry of, 577; British, 174; new, 454; pests in France, 579; spraying of, 419
Aquilegias, hybrid, 572, 750
Araucaria imbricata, the original at Kew, 232
Arboriculture in Kent, 628
Ard-Cairn, Daffodils at, 296
Aristolochia, internal structure of flower of the, 484
Art and Science, Summer School of, 329
Arum palæstinum, 174, 204
Arundina bambusæfolia, 298
Asclepias curassavica, 444
Ascott, Leighton Buzzard, 721
Ash, species of, 364
Ash, the, 293
Asparagus for forcing, 78; manures for, 259
Auricula seeds, raising of, 422; the, 445, 579
Auriculas, 176
Australia, fruit from, 452
Australian fruit, packing of, 692
Azalea indica, growth and culture of, 626, 712
Azaleodendron × Count de Kerchove, 665

B

Bacteria and leguminous plants, 742; in Elæagnus nodules, 577
Bacteria in the soil, 505
Baker, Mr. J. G., 746
Bamboos at Kew, 299
Bananas for the table, 146
Bangalore Botanic Garden, 391
Barn Elms, Barnes, 392
Barrier Island, 161
Barron, Mr. A. F., 633
Bean, Girtford Giant Runner, 665; the Windsor, 334
Beans, preserved, 454
Beaudesert, 164
Beaumontia grandiflora, 547
Beech Lawn, Audenshaw, 166
Begonia cinnabarina (Hybrida var. albo vittata), 19; Lansbergæ, 720
Begonias, winter-flowering, 106
Belgian notes, 108, 132, 230, 356
Belgium, 658
Belvoir, spring-flowering at, 741
Benary, Ernst, 385
Benefit and Provident Society, United Horticultural, 202
Benevolent Institution, Gardeners' Royal, 52, 74, 107, 112, 174, 202, 361, 513
Bennett, Mr. E., 547
Bergmann, M. Ernest, 747
Birds of New Zealand, native, 391
Birmingham Botanical Gardens, 208, 553, 683
Blackmoor House, 328
Blinds, paper Venetian, 723
Boilers, 578

Books, Notices of: — Annales Agronomiques, 170; Bibliographia de la Rosa, 235; Boletim da Sociedade Broteriana, 201; Botanical Magazine, the, 46, 200, 420, 546, 719; Botanische Zeitung, 170; Cassell's Popular Gardening, 265; Celery for Profit (*T. Greiner*), 605; Ceylon, Handbook to the Flora of, 18; Contributions from the Botanical Laboratory of the University of Pennsylvania, 106; Cottage Gardening, 633, 720; Country Gentleman's Catalogue, 721; Das Kleine Haus mit Garten (*Lothar Abel*), 81; Dictionnaire Pratique d'Horticulture, 201, 544; English Botany, 234; Ferns of South Africa (*Thos. R. Sim, F.R.H.S.*), 145; Field Club, the, 201; Food of Plants, the (*A. P. Laurie*), 605; Fruit Culture (*J. Cheal*), 720; Gardener's Story, a (*Geo. H. Ellwanger*), 81; Garden Oracle, the, 170; Geographical Journal, 17; Grasses of the Pacific Slope (*Dr. Vasey*), 107; Histoire des Plantes, 48; Icones Plantarum, 746; Illustrierte Monatshefte, 719; Index Kewensis, 748; Johnson's Gardeners' Dictionary, 234, 368; Journal of the American Pomological Society, 201; Journal of the Kew Guild, 604; Journal of the Royal Horticultural Society, 200; Kew Bulletin, 362, 632; Les Plantes de Grande Culture, Vilmorin, Andrieux et Cie., 266; Les Plantes Potagères et la Culture Maraichère, 201; Les Orchidées de Semis, 171; Manual of Orchidaceous Plants, Part IX., 515; Odorographia: a Natural History of Raw Materials and Drugs used in the Perfume Industry (*J. Ch. Sawer, F.L.S.*), 20; Orchidées Rustiques (*H. Correvon*), 718; Orchid Review, the, 46, 201, 420; Pamphlet on the Potato (*Jas. Dobbie*), 300; Primer of Horticulture (*Jno. Wright*), 296; Report on Insects and Fungi Injurious to Crops, 514; Revue de l'Horticulture Belge, 170; Rosarian's Year Book, 106; The Rose (*H. B. Ellwanger*), 266; Text-Book of Tropical Agriculture (*Alfred Nicholls, M.D.*), 145; The Wild Rabbit (*J. S. Simpson*), 544; Vegetable and Fruit Farming, Hints on, 48

Bordeaux Mixture, 666, 722
Boscawen, the late J. T., 172
Botanic Garden, Glasgow, 107
Botanic Gardens, Manchester, 140
Botanic institutions, list of, 108
Botanist, the selfish, 75, 110
Bougainvilleas, 323
Bouvardias, 323, 714
Brentford market, the, 599
Broccoli, 421; hardy, 333; and the frost, 363; the preservation of, 230, 333; Suttons' Late Queen, 366
Bruges, Orchids at, 356
Brussels, cut flower trade of, 749; Orchids at, 18
Buitenzorg Botanic Garden, 68
Bulbophyllum comosum, 298; B. Pechei, 298
Bull's, W., new plants at, 413
Burnpark, Orchids at, 656
Burns, Robert, and gardening, 265
Bystock, Orchids at, 10

C

Cabbage, Ellam's Early, 635
Cacao, 24
Caladium argyrites, 630
Calanthe Oweniana, 712
California, 289, 388, 657, 739
Calla Pentlandii, 516
Calochortus, the, 748
Camellia reticulata, 485
Camellias at Titsey Park, 267; hardiness of, 111; lifting, 323
Canna, synopsis of the species of, 42, 70, 164, 196
Cannas, 142, 743
Cannes, the recent winter at, 628
Canning, 422
Canton, letter from, 260
Cape, fruit from the, 106
Caralluma campanulata, 47
Carex japonica variegata, 172
Carnation, the, 176, 682; Duke of York, 520; chemical constituents of the, 570
Carnations and Picotees, 744
Carrot, monstrosity of the flower of the, 137
Catalpa speciosa, 721
Caterpillars, 484, 750
Cattleya, a mis-shapen, 665; C. Gaskelliana, 741; C. labiata, 235; C. l. Mendelii, Clarke's var., 688; C. Trianæ "Fairy," 292; C. T. var. Gravesiæ, 357; C. Warocqueana alba, 50; C. Warscewiczii, 712
Celastrus buxifolius, 397
Centenarian gardener, a, 692
Cereus grandiflorus, 664
Chamærops excelsa in Cornwall, 664
Chicago Exposition, 48, 201, 656; Primulas at the exhibition at, 293
Chicory, 387
Chiswick, Pæonies at, 693
Chlorophytum elatum variegatum, 101
Chou de Bedford, Laxton's, 71
Chrysanthemum cinerariæfolium, 750
Chrysanthemum exhibition in Vienna, 719; grafting, 18; variation, 363
Chrysanthemums, 140, 578; all the year round, 667; for training, 393; in the colonies, 82; single-flowered, 364, 454
Cladophora aegagropila, 265
Clerodendron Baronianum, 234
Clifton Cottage, Irises and Hemerocallis at, 743
Clivedon House, 541
Coccidæ or scale-insects on Orchids, 548
Coccocypselum hirsutum, 201
Cocoa-nut, double, at Kew, 74
Cœlogyne Hookeriana, 322; C. Sanderæ, 360, 391
Coffee disease in Jamaica, 303; plantations, 146
Coir, paving blocks of, 331
Colorado, West, 660
Coltsfoot, 234
Conditions, effect of local, on horticulture, 100
Conifers, trimming of, 454
Continent, a journey through, 686, 741

Coombe Warren House, 663
Copperas in plant manures, 719
Coprosma Baueriana variegata, 134
Coris monspeliensis, 748
Count Kerchove de Denterghem, 449
Crichel House Gardens, 508
Crickets, remedy against, 363
Crinodendron Hookeri, 634
Crinum pedunculatum, 138; C. yemense, 658
Crocus Sieberi, 293; C. striped, 422
Crotalaria juncea, 138; C. longirostrata, 234
Cucumber disease, 579; rot, 668
Cultural science, 746
Cupressus (Retinospora) obtusa and its varieties, 715, 743
Currant-bud mite, the, 232
Curtains, India-rubber, 754
Cyanophyllum magnificum from seed, 50
Cycnoches pentadactylon, 597
Cymbidium grandiflorum, 135
Cynorchis grandiflora, 197
Cypress, Lawson's, Haskins' variety, 146
Cypripedium Albertianum×, 19; C. calceolus, 667; C. Eucharis, 195; C. fasciculatum, 47; C. ×Hebe, 357; C. Lucienianum, 132, 322; C. ×memoria Moensi, 132; C. Moens, 322; C. Paris×, 444; C. villosum violaceum, 195; C. Tacita, 357
Cypripediums, hybrids, variability of, 163
Cyrtopodium Aliciæ, 711

D

Daffodils at Cork, 296; at the Antipodes, 174; for market, 383; in South of Ireland, 422
Dahlia, the, 607
Dahlias, new, 367
Daisy, the Michaelmas, 228
Dalmatia, insect-flower crops of, 742
Dammann & Co., new plants of, 414
Damper, an automatic, 48
Dandelion as a salad, 422
Daphne Mezereum, varieties of, 476
Dell, Egham, Orchids at the, 443
Dendrobium Hilli, 292; D. nobile, a fine plant of, 508; D. nobile nobilius, 386; D. Owenianum×, 226; D. Wardianum, 386; D. Wardianum var. gigantea, 292
Devonshire, flowers from, 298
Dianthus, the, 546
Dioon pectinatum, 718
Dioscorea in the Caucasus, 331
Diospyros costata, 50
Disa tripetaloides, 711
Dombeya rotundifolia, 397
Douglas Fir, the, 48
Dracæna Draco, 687; D. Sanderiana ? = D. thalioides, 576, 634
Dracænopsis australis at Belgrove, 133
Dragon's Blood, 687
Drought, the, 750
Dryden Bank, 79

E

Earl's Court Exhibition, 193, 330, 513
Echium arborescens, 690
Elæagnus angustifolius, root-nodules of (Bacteria), 577
Elder, the golden-leaved, 721
Emigration to Colonies and South America, 77
Environment, effect of, 100
Epidendrum spondiadum, 46
Eranthis cilicica, 266
Eremurus robustus, 694
Eritrichium nanum, 422; E. nothofulvum, 13
Eryngium campestre, 301
Erythea edulis, 507, 578
Erythrina crista-galli, 476; E. Zeyheri, 397
Erythronium Hartwegi, 516
Eucalypts, hardy, 207, 665
Eucalyptus coccifera, hardiness of, 237; E. cordata, 634; E. globulus, hardiness of, 234, 268
Eucalyptus, grafting of, 194
Eucalyptus oil, 604
Eucharis amazonica, 547
Eupatoriums, 301
Evergreens in pots, 164
Examination for gardeners, 22
Examinations in horticulture, 110, 390
Examinations of the Royal Horticultural Society, 267, 331, 747
Experiments at Rothamsted, 265

F

Fagus Moorei, 720
Fairlawn, Wimbledon Common, 268
Falmouth, climate in winter, 172
Fernery at Mr. May's, Edmonton, 323; the hardy, 323, 386
Fertilisers, law relating to the sale of, 719
Ficus elastica, 133
"Finches," the, Lindfield, 625
Finnochio, 366
Fish, gold, treatment of, 204
Flower garden, the, 14, 45, 72, 102, 134, 167, 199, 231, 262, 295, 327, 359, 389, 417, 447, 478, 511, 542, 572, 601, 631, 661, 689, 707, 745
Flowers under deciduous trees, 141
Fog, the town, 328
Folk-lore and Sage, 237
Fonthill Abbey, 39
Footpath Preservation Society, 171
Footpaths, 301; in pleasure-grounds, 334
Forestry, 13, 102, 197, 293, 324, 521
Forestry and Gardening Exhibition, opening of, 602
Forget-me-Not, sweet-scented, 13
Forsythias, the, 332
France, &c., a journey through, 741; Double Daffodils and Roman Hyacinths from, 606
Freesias, 130, 174, 394
Frost at Belvoir, 362; and the Roses, 100
Frosts and the fruit bloom, 483
Frozen flowers from New Zealand, 234, 751
Fruit cultivation and imported fruits, 139; from the Cape, 106; Colonies, transport of, 626; South Africa, 76; in Wilts, 749; prospects, 548, 686; selling and growing, 136; trees, summer pinching, 578, 606, 662, 666, 694, 728, 749
Fruits, preserved, 142
Fruits under glass, 45, 73, 102, 135, 166, 198, 231, 263, 294, 326, 358, 388, 417, 446, 478, 510, 542, 573, 601, 631, 661, 688, 716, 744
Fuchsia triphylla, 683
Fuchsias at Chelsea Nursery, 200
Fungi on flowers, influence of, 235; on the human body, action of, by C. B. Plowright, 138
Furcræa Bedinghausii, 747

G

Galanthus Fosteri, 237; winter blooming, 142
Gardenias, 143; in Sierra Leone, 207
"Gardens, grave and gay," 67
Gazania pygmæa, 397
Germany, hardy plants in, 132
Germination under difficulties, 104
Gentiana acaulis, watered with ice-water, 552
Ghent Quinquennial Exhibition, 203, 420, 480, 512; new plants at, 442, 471; hints for visitors to, 441
Gladiolus Childsii, 78; G. Nanceianus, 130; G. oppositiflorus, 291
Glasgow Botanic Gardens and Parks, 107
Glasnevin Botanic Gardens, 18
Gold fish, management of, 141, 174, 267, 333, 364
Gomphocarpus, 397
Gooseberry caterpillar, the, 392; sawfly, remedy for, 551
Graft hybrid, a, 544
Grafting of Rhubarb leaves, natural, 392
Grange, Alresford, fruits of the, 634
Grape, Barbarossa, 174, 204; Gros Colmar, 111, 172, 205, 238, 301, 333; Muscat Champion, 50, 78, 111, 238
Grapes, English, in American markets, 24; packing, 515
Greece, Currant crops in, 546
Grevillea robusta, 142
Gustavia pterocarpa, 130

H

Hamamelis, the genus, 303
Hampton Court, the home park at, 104
Hardy fruit garden, 14, 44, 72, 103, 135, 166, 198, 231, 263, 295, 327, 359, 389, 416, 447, 479, 511, 542, 573, 600, 630, 661, 689, 717, 745
Harvest of 1892...633
Hasskarl, Dr. Justus Karl, 331
Hawfinches, destruction caused by, 141
Hazel, a hermaphrodite, 633
Hazelbourne, Dorking, 712
Heating greenhouses, 141
Helichrysum cæspititium, 397
Helleborus fœtidus, poisoning by, 301
Hemerocallis, a new, 394
Hippeastrum, the, 323
Hives, wrappings for, 71
Holly and Oak, 422; growing on Oak, 364
Hollyhock, the, 176, 628
Honesty, 578
Hong-Kong, 228; ice in, 418; Orchid cultivation in, 83
Horticultural Club, 203
Horticultural College, Swanley, 331, 634, 693, 719; instruction, 75
Hybrids, 16; analogy of, 360
Hyde Park, spring bedding in, 552
Hydnophytum, 259
Hydrangea hortensis, blue colouring of, 684, 750
Hye-Leysen, M. Jules, the garden of, 606
Hypericum Moserianum, 476
Hypoestes moschata, 77

I

Ice in Hong-Kong, 418
Illicium floridanum, 386
Insect enemies of the Rose, 682
Insects on fruit trees, 607; on Pear trees, 749
Institute of Horticulture, 635; proposal for, 606
Investment, a profitable, 129
Iris alata, 50; var. Leichtlinii, 171
Iris Hookeriana, 47; I. stylosa for winter, 694
Irises and Hemerocallis at Clifton Cottage, 741; Irises, the Japanese, 168, 204; the Oncocylus group of, 266
Irish garden, Kilmacurragh, 709
Isle of Man, the, 655
Isopyrum thalictroides, 364
Italy, a journey through, 741; notes from, 13
Ivies, tender, 300
Ixora siphonantha, 234; I. Westii, 723

J

Jaffa, Orange trade of, 719
Jamaica, Coffee disease in, 303
Japan, flora of, 170
Jardin des Plantes, 137, 515
Johannesburg, a public park for, 330; notes from, 630

K

Kaki, 50
Keele Hall, 10
Keir House, Dunblane, 537
Kew, Bamboos at, 299
Kew Bulletin, 632
Kew, Eyot, 691; Guild, the, 690; Lilies at, 743; hardy plant-house at, 423; notes, 130, 332, 658; the show-house at, 106
Kilmacurragh Gardens, 709
Kitchen garden, the 15, 44, 73, 103, 133, 167, 199, 231, 263, 295, 326, 359, 389, 416, 446, 479, 510, 542, 573, 600, 630, 661, 689, 717, 745
Kniphofias, 170
Kumaon, notes from, 627

L

Label, Wood's Plant Club, 236
Labels, 265, 333
Lachenalia aurea gigantea, 290, 364, 394; L. tricolor, 394
Lachenalias at Kew, 423
Lælia vitellina, 365
Lælio-Cattleya amœna × var. delicata, 443
Lælio-Cattleya × Maynardi, 715
Landscape gardening, English style of, 567
Lapagerias, 452
Lastrea, an aposporous, 549
Lathyrus latifolius, in pots, 606

Law Notes:—Grimwood *v.* Weekes, 610; King *v.* End, 24; Royal Horticultural Society of Aberdeen *v.* Jas. Cocker & Sons, 425; Williams *v.* Keynsham Hort. Soc., 521
Leaf-mould, properties of, 110, 227
Leaves, the colouring matter of, 18
Lee, Mr. Jno., 259
Leguminous plants and bacteria, 742
Lemoine's new plants, 414
Leschenaultia biloba major, 753
Lightning on the Vine, action of, 720

Planting, 476

PLANTS NEW OR NOTEWORTHY, DESCRIBED:—Alocasia coriacea, 475; A. Watsoniana, 442; Arum Palæstinum, 98; Asplenium (erroneously printed Adiantum) duale, 10; Azalea Vaseyi, 539; Barbacenia squamosa, 414; Begonia Glory of Lorraine, 68; Bletia Godseffiana, 442; Brachionidium Sherringii, 290; Bulbophyllum Sanderianum, 291; B. vitiense, 291; Caladium sagittatum, 475; Calamus gracillimus, 475; Calanthe vestita var. Cornelius Vanderbilt, 322; Calypso borealis, 421; Cattleya× sub var. Reineckiana, 258; C. Trianæi Broomeana, 291; Chlorophytum brachystachyum, 710; Cœlogyne Clarkei, 741; Cotyledon Barbeyi, 624; Crassula centauroides, 656; Crocus Tauri, 226; Cyanophyllum aspersum, 475; Cypripedium Albertianum, 19; C. Alfred Bleu, 226; C. Calypso (Cypher's variety), 130; C. concolor var. striata, ; C. Lowianum aureum, 682; C. × sylva, 682; C. villosum var. Gortoni, 40; Cyrtanthus intermedius, 413; C. obliquus, 596; Dendrobium Benita, 354; D. (hybridum) Cassiope, 290; D. nobile Ballianum, 322; D. Owenianum ×, 226; D. rubens ×, 226; D. (hybridum) Venus, 291; Dichorizandra angustifolia, 475; Disa kewensis, 625; Dracæna Sanderiana ? = D. thalioides, 442; Epidendrum Palmeri, 322; Eranthis cilicica, 266; Eucharis Lowi, 538; Fritillaria citrina, 538; F. Whittalli, 506; F. Zagrica, 568; Galanthus Byzantinus, 226; G. Elwesii var. robustus, 226; G. gracilis, 656; G. Ikariæ, 506; G. maximus, 354; G. Perryii, 256; Gladiolus papilio, ×Gandavensis, 596; G. victoralis ×Sprenger, 596; G. hybrid, 596, 624; Heliconia illustris, 413; Hillia tetrandra, 414; Hypolytrum Schroderianum, 414; Iris Athoa, 711; I. Bismarckiana, 506; Kniphofia longicollis, 682; Pholidota Lugardi, 322; Kniphofia Tuckii, 68; Lachenalia aurea gigantea, 290; Lælia Finckeniana, 194; L. hybrida Normanni, 98; L.× Oweniana, 682; Lælio-Cattleya Schilleriana, 596; Lathyrus splendens, 258; Ludovia crenifolia, 442; Magnolia salicifolia, 258; Masdevallia Henrietta×, 740; M. Rebecca×, 740; Megaclinium minutum, 291; Narcissus, Dammann's hybrid, 507; hybrid, 428; Nepenthes mixta×, 46; Nerine mutabilis, 130; novelties of 1892, 7; Odontoglossum blandum var. albocupreum, 355; O. crispum, Hunter's variety, 194; O. c. var. Mrs. De Barri Crawshay, 741; O. Kränzlinii, 442; O. lanceans var. Gravesianum, 322; O. Williamsianum, 740; Oncidium Saintlegerianum, 10, 227; O. spilopterum, 10; Oreopanax Sanderianum, 442; Papaver umbrosum, fl.-pl., 40; Pelexia maculata, 322; Phaius amabilis×, 226; P. roseus, 291; Phyllogathis ciliata, 475; Picea Breweriana, 258; Pleurothallis rhombipetala, 290; Richardia Lutwychei, 568; Saintpaulia ionantha, 682; Salmia Laucheana, 442; Sarcochilus muscosus, 322; Schizocodon soldanelloides, 415; Scilla Buchanani, 568; leucophylla, 506; Scopolia carniolica var. Hladnickiana, 418; Selaginella usta, 414; Senecio sagittifolius, 258, 355; Stachys floridana, 40; Strobilanthes Dyerianus, 442; Tradescantia velutina, 475; Tulipa coccinea, 538; Vanda× Miss Joaquim, 740; Vriesia tesselata var. Sanderæ, 442

PLANT PORTRAITS: Acer nikoense, 547; Agave Victoria Regina, 332; Anthurium Andreanum var. Warnbeckeanum, 547; Apple Eliza Rathke, 107; A. MacMahon, 547; Aristolochia gigantea, 547; Ascyrum crux Andreæ, 721; Aster roseus, 332; Azalea (hybrida) Daviesi, 203; A. indica Marie Theresa, 332; Begonia Baumanni, 163; B. fulgens, 163; Begonia Lansbergii, 475; Bilbergia Bruanti, 332; Bulbophyllum tesselatum, 475; Boronia heterophylla, 721; Brugmansia aurea, 162; Buddleia Colvillei, 748; Calamus robustus, 332; Calochortus Kennedyi, 332; Cattleya Alexandræ, 162; C. Hardyana×, 547; C. labiata, 332; C. labiata vars., 721; C. Mossiæ Reineckiana, 721; Cherry, Early Prin, 748; Cherry, Bigarreau Lemercier, 203; Clerodendron hastatum, 162; Cochlioda Noetzliana, 107; Cœlogyne Sanderæ, 547; Colax jugosus, 721; Cornus Kousa, 547; Crocus luteus var. striatus, 385; Cupania elegans, 474; Cymbidium Lowianum, 547, 577; Cypripedium Chamberlainii, 577; C. Dibden ×, 162; C. Galatea, 577; C. Huybrechtianum, 748; C. Leonæ×, 162; C. Rothschidianum, 577; C. Spicerianum var. Mercatellianum, 721; Cyrtopodium Aliciæ, 721; Cyrtosperma ferox, 474; Dendrobium (hyb.) Cassiope, 332; D. Phalænopsis Schroderianum, 577; D. (hyb.) Venus, 332; Dichorizandra musaica gigantea, 474; Dieffenbachia meleagris, 474; D. olbia, 475; Disanthus cercidifolia, 748; Dracæna cuprea, 203; Epimedium macranthum, 107; Eulophiella Elisabethæ, 474; Gleditschia japonica, 577; Habenaria militaris, 721; Hæmanthus Lindeni, 474, 577; Heliconia spectabilis, 475; Iris atrofusca, 384; Labisia smaragdina, 474; Lælio-Cattleya Ridolfiana, 517; Lathræa clandestina, 721; Lathyrus grandiflorus, 203; Lycaste macrobulbon, 577; Mitchella repens, 577; Narcissus Fenzlii, 385; N. Margaritæ, 384; N. Sprengeri, 385; Odontoglossum Harryanum, 203; O. Insleayi, 577; O. ramosissimum, 332; O. Ruckerianum splendens, 385; Oncidium loxense, 577; Opuntia prolifera, 108; Papaver orientale, 108; Pavonia Wrightii, 108; Pellæa gracilis, 577; Peperomia metallica, 474; Phalænopsis Luddemanniana, 577; Philodendron verrucosum, 721; Prunus cerasifera var. Pissardi, 577; Rhodochiton volubile, 203; Rudbeckia purpurea, 721; Senecio Bonin-Simæ, 577; Smilax argyrea, 474; Solanum jasminoides, 332; Stenandrium (hybridum) Goosenianum, 203; S. Lindenii, 474; Stuartia pseudo-Camellia, 577; Tradescantia elongata, 474; T. reginæ, 474; T. superba, 474; Tricyrtis nana, 721; Triteleia uniflora cœrulea, 721; Tritoma corallina, 203; Vanda tricolor var. planilabris, 721; Vriesia (hybrida) Pommer Escherana, 721; Wahlenbergia pumiliorum, 203

Plants for decoration, select foliage, 133, 262, 477, 572
Plants, new, of 1892 ... 7, 52 (see also Plants new and noteworthy).
Plants, new substances from, 484
Plants under glass, culture of, 14, 45, 73, 102, 134, 167, 199, 231, 262, 294, 326, 358, 388, 417, 447, 479, 511, 542, 572, 601, 631, 661, 689, 716, 744

Friday Next, Jan. 13.

ODONTOGLOSSUM EDWARDI,
ODONTOGLOSSUM HALLI,
ODONTOGLOSSUM CIRROSUM.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and 213, Park Road, Clapham, S.W., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, January 13, at half past 12 o'Clock, a large and healthy consignment of

ECUADORIAN ORCHIDS,

just received in the best possible condition, consisting of—

ODONTOGLOSSUM HALLI, one of the grandest and best Odontoglossums grown, well adapted for cutting and showing purposes. It is a variable species, and several extraordinary fine forms have been flowered from our previous consignments. There are two distinct varieties—one with beautifully deep-spotted flower and pure white lip, leucoglossum; the other with a yellow lip, larger flowers, but less coloured, xanthoglossum—both varieties are found growing together.

ODONTOGLOSSUM EDWARDI.—The violet-coloured Odontoglossum, a very distinct beautiful species, discovered by our collector, Mr. Ecklaboch. The flowers are produced on large panicles; though individually small, they are nevertheless very effective, on account of their number. Sepals and petals violet-purple, lip of same colour, with sulphur-yellow apex; deliciously-scented; flowering season, end of January to March.

ODONTOGLOSSUM CIRROSUM.—A most charming, elegant species, equally as useful as O. crispum. Flowers creamy, white spotted, and blotched with maroon-crimson; they are borne in great number, on long panicles. This species is very variable, both in form of their flowers and marking of the segments. Many pretty and valuable forms have flowered out of our previous consignments. The plants offered are the large-bulbed type, and the best-conditioned ever offered; they can be recommended with every confidence.

On view morning of Sale, and Catalogues had.

Thursday Next.

IMPORTANT SALE. TO THE TRADE AND PRIVATE BUYERS.

7000 extra-fine AMERICAN PEARL TUBEROSES, Second Portion, just to hand, in splendid condition; 2000 GLADIOLUS LEMOINEI HYBRIDS (the Blotched Butterfly Gladiolus), 1000 GLADIOLUS BRENCHLEYENSIS, extra large roots; 300 very fine Clumps LILY OF THE VALLEY, 300 VALLOTA PURPUREA, 200 DIELYTRA SPECTABILIS, 100 AMARYLLIS JOHNSONII, large Bulbs; 100 CALADIUMS in dry Tubers, very large; CANNAS (Madame Crozy), 3000 JAPANESE LILIES, including auratum, rubro vittatum, rubrum cruentum, album Kraetzeri, Melpomene elegans and longiflorum, all good varieties for Show and Cut Bloom; Lilium umbellatum, L. tigrinum, three varieties; SPIRÆA COMPACTA MULTIFLORA, AZALEA INDICA, amongst them large plants; PALMS in variety; together with the SURPLUS STOCK of DUTCH BULBS from a large London Seedsman.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on THURSDAY NEXT, January 12, at 12 o'Clock precisely.

On view morning of Sale, and Catalogues had.

The Studley Castle Collection of Orchids, Palms, FERNS, STOVE and GREENHOUSE PLANTS, &c.

MR. J. C. STEVENS has received instructions from the Official Receiver in Bankruptcy to SELL by AUCTION, EARLY in FEBRUARY, the valuable COLLECTION of ORCHIDS formed by T. Walker, Esq., of Studley Castle, Warwick, including, amongst others—

Cypripedium Spicerianum, best variety	Dendrobium thyrsiflorum, fine specimens
,, cardinale	Cattleya Warocqueana
,, Schroderæ	Cœlogyne cristata, fine specimen
,, Hincksianum	Lælia anceps alba
,, Haynaldianum	Cypripedium insigne
,, Elliotianum	Lycaste Skinneri alba
,, bellatulum	Maxillaria Lehmannii
,, œnanthum superbum	,, picta
,, Measuresianum	Cymbidium Lowii
Dendrobium prismatocarpum, fine plant	Stanhopea tigrina
	Cœlogyne Massangeana, &c.

Also the well-grown PALMS, FERNS, and other STOVE and GREENHOUSE PLANTS.

Auction Rooms & Offices, 38, King St., Covent Garden, W.C.

Heston, Middlesex.

On the main Bath road, near Cranford, Whitton, Hounslow, Isleworth, &c.

VALUABLE FREEHOLD PROPERTY, comprising about 12 Acres of prolific MARKET FRUIT GARDENS, in a high state of cultivation, and planted with a profusion of the finest Fruit-bearing Trees, together with all the requisite appliances for carrying on the Business of Fruit and Vegetable Growing on a large and profitable scale; also a capital brick-built and slated Residence of 8 rooms, with the usual outbuildings and a Foreman's Lodge, the whole enclosed within fences, and having an extensive frontage to the old Great Bath Road, about 1¾ mile from the L. & S.W.R. Station at Hounslow, within half-a-mile of Hounslow Barracks Station on the Metropolitan Extension Railway, and about 12 miles of Covent Garden Market.

MESSRS. SAMUEL B. CLARK AND SON will offer the above important FREEHOLD PROPERTY for SALE by AUCTION, in one lot, at the Mart, Tokenhouse Yard, E.C., on TUESDAY, January 31, at 1 o'Clock precisely.

Particulars, with Conditions of Sale, may be had of the Solicitors, Messrs. BIRCHAM AND CO., 46, Parliament Street; and of the Auctioneers, at their Offices, 8, New Cavendish Street, W., and 10, Hanover Square, W.

WANTED to RENT, on Lease, about 1 Acre of LAND for a NURSERY, within 15 miles of Covent Garden, with a small Cottage adjoining.—G. H., Mr. James Wingfield, Wedmore Nursery, Bromley, Kent.

WANTED, to RENT or LEASE, GENTLEMAN'S GARDEN or NURSERY, with plenty of Glass. Near good Market Town.—M. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, to RENT, about half-an-acre of GROUND, for Flower Culture, either with or without Houses. Neighbourhood of Isleworth preferred.—Address, X. Y., Mr. J. Picknell, 4, Earl's Court Road, Kensington Road.

Cheltenham.

TO FRUIT GROWERS, MARKET GARDENERS, and OTHERS.

TO LET, one of the most valuable MARKET GARDENS in the county. The Property extends over an area of about 11 acres, and is well stocked with the choicest Fruit Trees. The extensive Vineries and Peach-house, together with a pretty Villa Residence, Stabling, Shedding, Piggeries, &c., are all most conveniently arranged upon the property. Ingoing by Valuation. To a moderate capitalist the above offers an exceedingly rare and lucrative investment. Possession at once.

For further particulars apply to S. P. VARDER, Estate Agent, Auctioneer and Valuer, Albion Chambers, Clarence Parade, Cheltenham.

FOR SALE, the prettiest little VILLA RESIDENCE in Brighton; about 140 rods of Ground, Greenhouse, Chicken-runs, &c., Freehold. Well adapted for Greenhouses and Poultry Rearing. Splendid Views. Quite private. Central.—Apply to E. W. CHESTER, 49, Dyke Road, Brighton. No agents.

FRUITERERS, FLORISTS, and GREENGROCERS' BUSINESS for DISPOSAL in first-class suburb, West. Family trade at best prices. Lease, Goodwill, Fittings, and all Trade Utensils, Four Vans, Four Horses, and Two Trucks. Lowest Price, £500. Compact house in capital repair, and Stabling for four horses on premises. Apply, by letter, in first instance, to Mr. W. J. SMITH, House and Business Agent, 232, King Street, Hammersmith.

FOR SALE, a FLORIST'S BUSINESS, with House, at £92 per annum. Same hands 15 years. Double-fronted Shop, West End, doing £1000 a year. Tools included; shop nicely fitted up. Business to be had for £200.—G. LONGHURST, 18, St. Anne's Road, Notting Hill.

FRUITERER'S and FLORIST'S.—Leading position in flourishing West of England Town, doing £1500 yearly, on Lease. Also, the FREEHOLD NURSERIES in connection with the above, being about 4½ acres, including large Dwelling-house, 450 feet run of Glass, and useful Outbuildings. Main Road. Trams pass entrance. Above, together or separate.—Apply, C. C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

To Nurserymen and Florists, New Southgate.

BUSINESS of a FLORIST.—Greenhouses, Frames, Stock of Bedding Plants, Ferns, &c. Going concern, with Eight-roomed House and Ground. HOUSE to LET. Stock and Fixtures to be SOLD.—For particulars, apply to H., 49, Spencer Street, E.C.

To Fruit Growers, Florists, &c

TO BE DISPOSED OF, the GOODWILL and LEASE of an old-established FLORIST and FRUITERERS' BUSINESS, situate in a Central Position in one of the Foremost Watering Places in England. There is a large Garden in connection with the business, with 300 feet of Glass, nearly all of which is heated, and Stocked with Vines, Peach Trees, &c. More land may be had if required. The Owner, who is retiring, is desirous of selling the Goodwill, and will grant a fourteen years' lease; or he will be disposed to consider offers for the Purchase of the Property. The premium required would include the business plant and fixtures, stock and growing crops as at the time of transfer. For particulars address T. L., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Fifty Nurseries, Market Gardens, Florist and Seed BUSINESSES to be DISPOSED OF.

MESSRS. PROTHEROE AND MORRIS' HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained, gratis, at 67 and 68, Cheapside, London, E.C.

Fruit, Vegetable, and Flower Section,
LONDON CENTRAL GENERAL MARKET, SMITHFIELD.

NOTICE is HEREBY GIVEN, that with a view to give a further impetus to the Trade of this Market, the COLLECTION of the TOLLS, as set out in the Bye Laws of the Bye Laws, will, except in certain specified cases, be SUSPENDED for a period of twelve months, commencing on MONDAY, January 2, 1893.
Guildhall, E.C., December, 1892. MONCKTON.

Enoch White, deceased.
Pursuant to the Statute 22 & 23 Vict. c. 35.

NOTICE IS HEREBY GIVEN, that all persons having any claims or demands against the estate of Enoch White, late of No. 23, Holdenhurst Road, Bournemouth, in the county of Southampton, Nurseryman and Florist, deceased (who died on the 4th day of January, 1890, and whose will was proved in the Principal Registry of the Probate Division of Her Majesty's High Court of Justice, on the 15th day of May, 1890, by John James Dacombe, of Bournemouth aforesaid, Decorator, and Henry Pratt Moore, of the same place, Coachbuilder, the executors), are hereby required to send the particulars, in writing, of their claims or demands to us, the undersigned, the Solicitors for the said executors, on or before the 31st day of January, 1893; after which date the said executors will proceed to distribute the assets of the said deceased amongst the persons entitled thereto, having regard only to the claims and demands of which they shall then have had notice; and that they will not be liable for the assets of the said deceased, or any part thereof, so distributed, to any person or persons of whose claims they shall not then have had notice.—Dated this 23rd day of December, 1892.
J. AND W. F. DRUITT, Borough Chambers, Bournemouth, Solicitors for the Executors.

The Bournemouth and Victoria Nurseries,
SPRINGBOURNE.

MR. F. A. WHITE begs to announce, that having PURCHASED the ABOVE NURSERIES from the Executors of his Father, the late Mr. Enoch White, he now proposes to CONTINUE there the BUSINESS for so many years carried on by his late Father, and to solicit a continuance of the support for so many years accorded to the late Mr. Enoch White. The business will be carried on under the style of "ENOCH WHITE AND SONS."

A LEADING FEATURE.
GEO. JACKMAN & SON,
Woking Nursery, Woking, Surrey.
ESTABLISHED 1810.] [AREA, 150 ACRES.

VICTOR POTATOS
(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatoes have become discoloured and unsaleable.
The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.
Price per cwt. and ton. State requirements to
W. W. JOHNSON & SON,
Seed Growers and Merchants, Boston, Lincolnshire.

NEW CHRYSANTHEMUMS.

VANDA CŒRULEA.

A magnificent importation just received in splendid condition, and collector writes:—"I have never seen such a sight of this beautiful Vanda before. Every plant was in flower, and the colours grand—of the deepest indigo-blue, and the flowers very large. You cannot say a word too much of the colour and size of flowers. Every plant is the same."

INSPECTION RESPECTFULLY INVITED.

HUGH LOW & CO., Clapton Nursery, London, N.E.

H. CANNELL & SONS' BEGONIAS.

From the fact of us having last year ten Houses, each 100 feet long, full of plants specially for seeding, and bearing flowers similar to the one here shown, we are not only offering the finest and plumpest seeds, but seed from plants producing blooms of the highest ideal of perfection, and as a confirmative proof we simply mention that our dwarf strain has gained the greatest and most valuable prizes ever awarded; and further, we have obtained more Certificates for doubles, of real onward merit, than nearly all other exhibitors put together. We guarantee what we supply to be the best in every way yet offered, and if not as we describe, we will gladly refund the amount sent.

2s. 6d. and 5s. per Packet.

For both Gardeners and Gardens our CATALOGUE of our KENTISH SEEDS, sent post free to coming customers, and will be found a marvel of practical information. All our Seeds, both for strength and superiority of strain, will delight all that have them. Simply to show the growth of Trade, from the highest to the lowest all over the world, we append the following:—

IMPERIAL PALACE BACHE NAZE, CONSTANTINOPLE, *December* 23, 1892.

VEITCH'S NEW MELONS
OF SUPERB QUALITY.

GUNTON ORANGE
(Scarlet Flesh).
Awarded First-class Certificate, R.H.S., May 17, 1892.
A unique scarlet-fleshed Melon rather under medium size, nearly round, attractively netted, and of exquisite flavour. The plant is of robust constitution and a free setter.
Per Packet, 2s. 6d.

RITCHING'S PERFECTION
(Green Flesh).
Award of Merit, R.H.S., June 7, 1892.
A distinct and beautiful green-fleshed variety. In form it is almost round, slightly pointed at the stalk, medium sized, yellow, beautifully netted, and very handsome. The flesh is of great thickness and of delicious flavour.
Per Packet, 2s. 6d.

For full descriptions of the above and other Choice Novelties, see SEED CATALOGUE for 1893, forwarded Gratis and Post Free on application.

THE
Gardeners' Chronicle.
SATURDAY, JANUARY 7, 1893.

NOVELTIES OF 1892.

THIS year, as in some former ones, before sitting down to make our usual review of the plant gains to our gardens during the past year, we harboured the notion that the task would be light, but on looking over our running notes we find producers and introducers of novelties have not been idle during the interval, and the leading trade firms especially have well fulfilled the demands of progress.

The Orchids, as usual of late years, present themselves prominently in their two main divisions, viz., the imported novelty and the home-raised hybrid or cross-bred plant. In both these classes, the seeker after that which is excellent, is confronted by some difficulties; in the case of imported plants, through description based often on imperfect material, or on the collector's estimate of his discoveries; and in the matter of the hybrids and cross-breds, by the same results having been attained by different persons each of whom gives a different name to his novelty. Nevertheless, plants of excellence, both imported and home-raised, are soon singled out from the worthless or indifferent, and do not, as a rule, fall into the ranks of those of small value. Let us touch on our home industry first, and note some of the results of the hybridist's work.

Messrs. Jas. Veitch & Son stand well to the front; their hybrids of Cattleya, Lælia, Sophronitis, &c., would each of them make glad the heart of a collector of wild specimens in the tropics, and they are not the less acceptable that they are our own garden products. Indeed, the cost of raising and rearing good hybrids is equally as great as that of importing from the distant tropics, if the time, patience, skill, and expense on the one hand, are put against the sums staked on short-time ventures in the other.

Around the various crosses made with Sophronitis grandiflora as one parent, at Messrs. Veitch & Son's, much interest centres, as out of them large and gorgeously beautiful flowers, of glowing tints, are obtained on plants comparatively dwarf in stature. Following their charming Sophro-Cattleya Batemanniana and Epiphronitis Veitchi, they have flowered for the first time Sophro-Cattleya Veitchi × (S. grandiflora ♀, L.-C. elegans ♂), a lovely thing with showy flowers of a clear rosy-red, slightly orange-tinted and beautifully veined; and S.-C. Calypso × (S. grandiflora ♀, C. Loddigesi ♂), a glowing rose-pink flower with orange centre, both first-class novelties; Lælia Latona × (cinnabarina ♀, purpurata ♂) is another great acquisition, the bright yellow of

its sepals and petals and glowing purple of its beautifully-veined lip being very attractive features. All crosses with Lælia and Cattleya are sure to be acceptable, and the Lælio-Cattleya Cassiope× (L. pumila ♀, L.-C. exoniensis ♂), with large bright rosy-crimson flowers; Cattleya Philo ×, and C. P. albiflora ×, both the result of crossing C. Mossiæ with the singular and extremely rare C. iricolor; C. Minucia ×, (C. Loddigesii ♀, labiata var. ♂); C. leucoglossa × (Loddigesii ♀, Fausta ♂), with wax-like rose and white flowers, with rich yellow base to the lip; and the pretty little Lælia Aurora ×, have all been much admired by those who have seen them, and may be relied on to develop greater beauty when strong, for it is one of the difficulties which rare and difficult crosses have to contend with, that they have to pass under judgment with the first, and often imperfect flowers. In the great genus of Cypripediums, which are being worked by the hybridist on every hand, Messrs. Veitch have contributed during the past year some fine varieties in C. Adrastus × (Leeanum ♀, Boxalli ♂), C. Brysa × (Sedeni candidulum ♀, reticulatum ♂), with charming blush-coloured flowers, having a pale green tinge, and which, like the curiously-tinted C. Cleola ×, has many admirers; C. Ianthe × (Harrisianum ♀, venustum ♂), C. Telemachus × (niveum ♀, Lawrenceanum ♂), a fine improvement on its relative, C. Aphrodite; C. Evenor × (Argus ♀, bellatulum ♂), a grand variety resembling a massive C. Marshallianum ×; C. Arète (concolor ♀, Spicerianum ♂), beautifully spotted, and somewhat resembling C. microchilum ×; C. Tityus × (Spicerianum ♀, œnanthum superbum ♂), C. Perseus × (Sedeni porphyreum ♀, Lindleyanum ♂), C. Arthurianum pulchellum ×, and C. Eurylochus × (ciliolare ♀, hirsutissimum ♂).

Among other fine hybrids of the year raised by Messrs. Jas. Veitch & Son, specially remarkable are Epidendrum Endresio-Wallisii × (Endresi ♂, Wallisi ♀), a charming novelty with the violet tint finely developed in the blooms; Dendrobium Euryclea × (lituiflorum ♀, Wardianum ♂), a pretty companion to the favourite D. micans ×; Zygopetalum leucocheilum × (Burkei ♀, Mackayi ♂), in which the large white labellum is a distinct feature; and Phalænopsis Artemis × (amabilis ♀, rosea ♂), a pretty rose-coloured hybrid, bearing some resemblance to P. intermedia ×, which, as has been proved by seedlings raised by Mr. Seden, is P. Aphrodite × rosea, and thus the P. Artemis × of Messrs. Veitch has the true P. amabilis, Bl., for one of its parents, instead of P. amabilis, Lindl. and Hort. (P. Aphrodite, Rchb.).

Messrs. F. Sander & Co., of St. Albans, have long ago taken the lead as importers of Orchids, and in the matter of home-raised hybrids they come well to the front, their imported novelties and their hybrids during the past year equalling each other in excellence. Cypripedium Chamberlainianum, one of the most distinct, beautiful, and easily cultivated of all Cypripediums, is among their best; C. exul and other species or new varieties were also introduced. Cattleya Victoria Reginæ comes next, its large wax-like, clear rose-coloured flowers being superb. Unfortunately the importation was mixed, and although the C. Leopoldi Pernambuco var. imported with it, brought some grand varieties, it would have been better if a greater proportion of C. Victoria Reginæ had appeared; probably the next batch to flower will be all right. Messrs. Sander also share with M. Linden, the honour of having introduced C. Alexandræ. From both sides of the water the introduction was heralded with a great flourish of trumpets, but on the plants flowering, the music dwindled to the veriest squeak. Out of these large importations some fine varieties are sure to be found; but, on the whole, it would have been better to have selected something more ornate with which to honour our favourite Princess.

The St. Albans strain of Cattleya labiata vera was fortunate during the past year in producing grand novelties, the best of which are C. l. Sanderæ, C. l. albanensis, and the pure white C. l. alba, exhibited recently from the collection of M. Wells, Esq. Cattleya Amesiæ is a grand white Cattleya, and C. speciosissima Sanderiana, a noble white and fragrant variety; C. Oweniana, like a cream-white petalled C. Hardyana ×, but distinct enough to warrant a separate name; and the various new varieties of the St. Albans importations of C. granulosa and C. g. Schofieldiana, and notably the almost entirely purple-petalled C. g. princeps and C. Batalinii are all fine gains to our gardens, and admittedly new and pretty.

Of the genus Odontoglossum, which it was prophecied long ago as getting near to the end of its tether, so far as showy novelties were concerned, Messrs. Sander have belied the prediction by exhibiting several grand novelties during the year, the more remarkable of which were the large richly-spotted O. crispum Sanderæ, O. c. Wellsianum, some fine forms of O. Pescatorei, the beautiful O. Louryanum, O. Owenianum, O. Amesiæ, and O. Wendlandianum, all of which are probably natural hybrids which have been accorded specific rank. Of the allied genus, Miltonia vexillaria, M. Roezlii and their crosses; M. Bleui splendidissima, M. Roezlii, Sander's var., and eight varieties of M. vexillaria were awarded First-class Certificates when shown. Other new things of 1892, hailing from St. Albans, were Aërides Balfouri, a curious white species; Angræcum O'Brienianum, with large thick leaves and long racemes of white fragrant flowers, larger than those of A. Chailluanum; A. polyurum, Sobralia xantholeuca rubra, Schomburgkia Ericssoni, Phaius Sanderiana, the noblest of Phaius; Oncidium Rolfeanum, O. Gravesianum, and several other Oncidiums; Lycaste Skinneri var. F. L. Ames, and L. S. Mrs. F. L. Ames, a very handsome couple; several new Epidendrums; and out of their importation of Dendrobium Phalænopsis Schroderianum, D. P. Rothschildianum, a fine white variety with blush tinge; Cymbidium Humblotii, with stout erect spikes of emerald green and black flowers, as showy as those of Cœlogyne pandurata, which they much resemble; Calanthe Sanderiana, the showiest of the Calanthes of the C. veratrifolia section; Vanda Arbuthnotiana, some Cyrtopodiums, Disa Cooperi (new to cultivation), and other things, about which more will be known during the present year.

Of the St. Albans hybrids, Cattleya Burberryana × (C. intricata ♀, C. superba ♂), which was awarded a First-class Certificate at the Royal Horticultural Society on April 19, 1892, is a very showy plant; Lælia Oweniana (L. pumila Dayana ♀, L. xanthina ♂), a pretty hybrid; Calanthe orphanum, a variety with unrecorded parentage; Cattleya Parthenia nobilis ×, the best of its class; and Phalænopsis Amphitrite × (Stuartiana × Sanderiana) and Lælia Gravesiæ, both good.

Of the genus Cypripedium, Messrs. F. Sander & Co., during the past year, have flowered no less than two dozen distinct new hybrids, all of more or less beauty, but whose respective merits space forbids us to attempt to define.

In Baron Schroder's famous garden at Egham, many fine new plants have flowered, and among them, perhaps, the most beautiful has been his hybrid Cattleya × Baroness Schroder (C. Trianæ ♀, Jongheana ♂), a most beautifully-formed flower, of a clear rose-pink, with white and yellow throat, and finely-crimped lip. Three magnificent new forms of Odontoglossum crispum have there appeared, in the heavily-spotted beautiful O. c. var. nobilior, O. c. Rex, and O. c. var. Wolstenholmæ, the last variety having been exhibited before, but never in such superb condition as seen at the first June meeting of the Orchid Committee of the Royal Horticultural Society in 1892.

Sir Trevor Lawrence, Bart., has, as usual, flowered and exhibited many new Orchids, the Burford-raised hybrid Cypripedium Lawrebel × (Lawrenceanum ♀ × bellatulum ♂), in the front rank of hybrid Cypripediums. The beautiful hybrid Calanthes, too, raised in the same gardens, have culminated in a variety with blooms of the purest white, and also in C. × sanguinaria, whose blooms are of the richest crimson. Dendrobium Burfordiense × (Linawianum × heterocarpum) is a pretty Dendrobe, and as shown towards the end of last year, Cypripedium Morganiæ Burfordiense × is the finest form of a very fine hybrid. Among novelties in botanical Orchids the Burford collection has always a store; and among the Bulbophyllums, of which there is a fine collection there, the handsome citron-yellow B. Sillemianum has found a home as a rescued species, the type-plant described by Reichenbach for Mr. Sillem having nearly departed, when another plant was imported by Messrs. Hugh Low & Co., and was fortunate in going into the Burford Collection. The beautiful Spathoglottis rubra also flowered at Burford.

As a raiser of fine hybrid Orchids, Norman C. Cookson, Esq., of Oakwood, Wylam-on-Tyne, is a leader among the amateurs, and among his last year's contributions, Lælio-Cattleya Phœbe × (C. Mossiæ ♀, L. cinnabarina ♂), is a charming plant, the rich Indian yellow of its sepals and petals, and the glowing purplish-crimson of the front lobe of the lip, making these valuable additions to a class of colours in Orchids which only the practical hybridist appears able to evolve. Cypripedium Bryan × (philippinense ♀, Argus ♂) is a noble flower, and C. Youngianum superbum and C. Calypso × Oakwood var. great improvements, while the charming white Dendrobium Cassiope × (moniliforme ♀ (japonicum) nobile albiflorum ♂) rivals in favour the more showy D. Venus × of the same raiser. Charles Winn, Esq., of Selby Hill, Birmingham, gave evidence during the past year that he is now about to reap the reward for his years of intelligent intercrossing of Orchids. His Cypripedium Cleopatra ×, C. Edith Winn ×, Dendrobium Nestor, and others being good, but the finest hitherto is the magnificent Cymbidium Winnianum × (giganteum ♀, eburneum ♂), a specimen of which, with fine spikes, bearing together about forty flowers, was shown in November last. In size and form, the flowers resemble those of C. giganteum, but they are of ivory-white with purple spots and lines on the lip.

Messrs. B. S. Williams & Son, of Victoria and Paradise Nurseries, Upper Holloway, have in the beautiful groups regularly staged by them at the Royal Horticultural Society's meetings, often displayed the beauties of their handsome Cypripedium Pitcherianum, Williams' var., by far the finest of its class; and also others, including the new yellow Lycaste Youngii, a fine form of the white Lælia Perrinii nivea, &c.

Chas. Ingram, Esq., of Godalming, has flowered several new hybrid Orchids, of which Lælio-Cattleya Ingrami × (L. pumila Dayana ♀, C. Dowiana aurea ♂); and Cypripedium gigas × (Lawrenceanum ♀, Harrisianum nigrum ♂), are worthy to take their place among the best; Drewett O. Drewett, Esq., of Riding Mill-on-Tyne, another hybridist, has the pretty Cypripedium Juno × (Fairrieanum ♀, callosum ♂) and C. Ceres × (hirsutissimum ♀, Spicerianum ♂).

between L. albida and L. anceps Sanderiana; and G. D. Owen, Esq., Selwood, Rotherham, late in the year flowered Lælia anceps Oweniana, a grand flower with flaked segments; and Cattleya amethystoglossa, Selwood var.

Messrs. Hugh Low & Co., are continually importing Orchids, and they frequently get novelties sent to them—one of the most extraordinary of which was their Cattleya Schilleriana Lowii, in which the labellum is white veined with blue,

Lælia elegans, viz., L. e. superbissima and L. e. excellens.

R. Brooman White, Esq., of Arddarroch, whose collection of Cattleyas is very complete, has reached perfection of beauty in C. Mendeli Mrs. R. Brooman White; and C. J. Lucas, Esq., of Warnham Court, flowered the large new Sobralia Lucasiana, Lælia furfuracea, Lucas var., and the extraordinary Lælia grandis, Warnham Court variety.

FIG. 1.—KEELE HALL, NEWCASTLE-UNDER-LYME. (SEE P. 10.)

Sir Wm. Marriott, of Down House, Blandford, has produced a most extraordinary plant in Lælio-Cattleya Marriottiana × (L. flava ♀, C. Skinneri ♂). Messrs. Heath & Son, of Cheltenham, a taking variety in Cypripedium Swinburnei × (insigne Maulei ♀, Argus Mœnsii ♂); Captain Vipan a welcome novelty in Cyripedium Vipani × (lævigatum ♀, niveum ♂); W. Thompson, Esq., of Stone, the pretty hybrid Masdevallia between tovarensis and Veitchii.

C. W. Fincken, Esq., of Barnsley, has been fortunate enough to flower out of an importation by the Liverpool Horticultural Co., Lælia × Finckeniana, a supposed natural hybrid much like that of Zygopetalum Mackayi. Messrs. Low also flowered the new dwarf crimson Sobralia Lowii, the singular Stanhopea Lowii, Low's variety of Cypripedium Volonteanum, Lælia claptonensis (Dormani × elegans) and Phalænopsis Schilleriana purpurea.

Thos. Statter, Esq., of Stand Hall, Whitefield, Manchester, who grows only good things, sent good samples of them to the meetings of the Royal Horticultural Society last year, specially fine being the magnificent white-petalled Cattleya Statteriana, which is a worthy companion to the bright yellow C. aurea Statteriana; and two superb forms of the Turneri section of

Messrs. Linden, of l'Horticulture Internationale, Parc Leopold, Brussels, have, among other fine new plants exhibited the beautiful white Zygopetalum Lindeni, the richly purple-spotted Odontoglossum Pescatorei Lindeniæ, O. P. maculatum, the clear yellow O. triumphans chrysanthum, and O. Insleayi Lindeni, the singular-looking Coryanthes leucocorys, Cyrtopodium Aliciæ, Cycnoches peruviana, Mormodes Rolfeanum, &c.

Messrs. Charlesworth, Shuttleworth & Co., famed for fine Odontoglossums, have a very handsome novelty in O. Wilckeanum nobilius; a grand thing in Lælia præstans, Heaton var.

(which, however, they say is closely approached by others in their importation of it), and they have during the past year flowered several new botanical Orchids, amongst them Pleurothallis teretifolia.

Messrs. Pitcher & Manda of the United States Nurseries, Hextable, a great store of rare Cypripediums, &c., flowered Cypripedium Stonei candidum almost entirely ivory-white; C. Niobe, Shorthills var., &c.

Messrs. Lewis & Co. of Chase Side, Southgate, N., exhibited three fine plants in Cypripedium Southgatense ×, a bellatulum cross; the clear greenish-yellow Cymbidium Lowianum viride, Disa incarnata, with scarlet and yellow flowers; R. I. Measures, Esq., of Camberwell (who also first flowered Cypripedium exul, and the charming C. insigne, Cambridge Lodge var.), was fortunate enough to bloom Odontoglossum platycheilum; and the handsome Moorea irrorata, from the Royal Botanic Gardens, Glasnevin, Dublin, received a merited First-class Certificate; while various other novelties are the white Masdevallia Harryana Gravesiæ, of Mr. H. Graves of Orange, New Jersey, U.S.A.; the beautiful Bulbophyllum O'Brienianum, Vanda vitellina of Messrs. Seeger & Tropp, Coryanthes Wolfiana and Lælia anceps Wellsiana of the Liverpool Horticultural Company, the pure white Vanda teres alba, of Lord Rothschild; the massive Cypripedium Cowleyanum ×, of F. G. Tautz, Esq.; and many curious botanical Orchids.

The following novelties in Orchids have been illustrated in the *Gardeners' Chronicle* in the past year:—

Cattleya Victoria Reginæ, June 25, pp. 808 809.
Cypripedium Chamberlainianum, Feb. 20, p. 241.
Cypripedium exul, April 23, p. 523.
Cypripedium Lawrebel ×, April 30, p. 560.
Disa incarnata, May 14, p. 618.
Disa Cooperi, September 3, p. 269.
Lælio-Cattleya Phœbe, June 18, p. 791.
Masdevallia Gravesiæ, July 30, p. 131.
Moorea irrorata, April 16, p. 489.
Mormodes Rolfeanum, February 13, p. 203.
Odontoglossum crispum var. nobilior, February 20, p. 235.
Odontoglossum platycheilum, May 7, p. 587.
Oncidium Gravesianum, May 21, p. 651.
Zygopetalum Lindeniæ, February 6, p. 172.

(To be continued.)

New or Noteworthy Plants.

ADIANTUM DUALE, *Jenman, n.sp.*

Root-stock woody, oblique or decumbent, clothed with dark scales; stipites tufted, strong, stiff, dark, channelled, naked, or with a few small scales at the base, rachis similar; fronds oblong-lanceolate, pinnate, firm and stiff, dark glossy green, paler beneath, glabrous, ½ to 1¼ feet high, 2½ to 5 inches in width; the base truncate, gradually reduced at the top to the lobate-serrate acuminate apex; pinnæ spreading obliquely, oblong-lanceolate, acuminate, 1½ to 3 inches high, ⅓ to 1 inch in breadth, the base cut away shortly on the inferior side, the upper side expanded and often auricled, petiolate, the lower freely so, the margins conspicuously lobate-serrate, incised; veins once or twice forked, curved, the inferior fascicled or again pinnatiform; sori linear, ¼ to ¾ inch, in length, forming a single or double series on each side, diverging from the mid-vein at a narrow angle, single or double; involucres narrow, firm, even—Jamaica, locally frequent in the central parishes at the mean and higher elevations; gathered in St. Ann and Clarendon. The large fronds only have the sori diplazioid, and this character with the sharp and uniformly grouped teeth of the margins, readily characterise it from A. falcatum (A. crosum, Nutt.), which of local species it most resembles, and its other near allies A. macrophyllum, Swartz; A. Gardneri, Baker; and A. caudatum, Forst., of the eastern and southern hemispheres. *G. S. Jenman, Demerara.*

Oncidium Saintlegerianum.

I fear the figure of Oncidium spilopterum, *Bot. Reg.*, xxxi., t. 40, has been overlooked when this plant was described. When I saw the plants recently imported as a new species, I was sure I had grown it before. Later, Mr. C. J. Lucas sent me two flowers which I at once recognised as the plant I had years ago as O. spilopterum (a species which I think has been erroneously included by some in O. Batemanianum). At all events, so far as I can see, the plant described as O. Saintlegerianum is exactly that figured as O. spilopterum. As tending to show the inadvisability of making a specific difference in a slight but not constant feature, I may say that the two flowers sent by Mr. Lucas had in the one the small yellow-tipped side lobes to the labellum as in the *Bot. Reg.* figure, while in the other the side lobes were very large and brightly coloured. *James O'Brien.*

Orchid Notes and Gleanings.

ORCHIDS AT BYSTOCK, EXMOUTH.

Among the many Orchids now in flower at Bystock, under the able management of Mr. Swan, I observed, during a visit last week, a very fine lot of Calanthes, mostly of C. vestita, in 7-inch pots, carrying six to eight grand spikes, with upwards of forty flowers each on a large proportion of the spikes. For compactness and general good quality, it is seldom that a finer lot is seen. Cypripediums, of which there are many unflowered seedlings, looked in the highest health. Lælia anceps, and two large plants full of flower, of Restrepia elegans, were very fine. *Hy. J. C.*

KEELE HALL.

(see figs. 1 & 4.)

The first authentic owners of the Manor of Keele were the Knights Templars. When that order was abolished, it became the property of the Knights Hospitallers. At the Reformation, Henry VIII. sold it to Sir William Sneyd, of Bardwell. His son, "Raufe Snead" built there, according to Erdeswick, "a very proper and fine kind of house." The same quaint old historian attributes to this same fine old gentleman every virtue "in all good sort increasing his patrimony." The date of the sale was 1581, so the Sneads, or Sneyds, as the name is spelt now, have held Keele over 300 years; the family, however, can be traced back to Edward I.'s time. It was not the fault of Cromwell's Ironsides that Keele escaped, for the then owner (to use a Græcism) was Colonel Ralph Sneyd, who was heart and soul a royalist. In 1855 the present hall was built by another Ralph Sneyd, of red sandstone, in the same style as the former, namely, Elizabethan. There are some fine Old Masters in the house, also two of Sir Joshua Reynolds; but the picture that interested me most was the picture of the builder of the first house, "Raufe Sneade." The hall is situated on rising ground, and commands a view of pleasantly diversified parkland. Everything that could be thought of to make the grounds beautiful has been done. Indeed, Erdeswicke's words about the county of Stafford, "*terra sua contenta bonis*" might very fitly be applied to Keele.

The beautiful pleasure-grounds at Keele are divided, like omnis Gallia, into three parts—the first part near the house, the second above the kitchen garden, and the third beyond the kitchen garden. It is very surprising, as well as charming, to have fresh beauties thrust upon you in the way these are here. The windows of the south-front of the house look out upon a geometrical flower garden with clipped Yews at the salient angles, and a tastefully-designed fountain. A well-kept lawn divides this from the park. The west side causes one to linger a much longer time, because below the eyes at the foot of a sloping green sward, lies glittering the pretty lake. For its size this is the most tastefully designed piece of artificial water I ever saw, and this opinion was strengthened on descending the green carpet from the terrace to walk round it. The mantling with trees, with vistas cut through them of the further side, contrasted prettily with the shaven lawn on the nearer, and the meandering outline of both banks gave a river-like appearance. It was hard at last to tear oneself away, and one did so only with many fond looks.

To get to pleasure-ground No. 2, one has to go through what is called the Fern-drive. It is so-called because a deep cutting has been driven through the new red sandstone, to avoid making a *détour*. The sides of this cutting are so thickly clad with hardy Ferns, that the rock is quite obscured by their green fronds. Above the kitchen garden is a long straight terrace-walk, with a line of gaunt ancient Spanish Chestnuts the whole of the length of it. These wind-tossed seasoned trees must have seen come and go many generations of Sneyds. For about 50 yards at the end of the walk a line of tall Scotch Firs, with bare, brown, tapering trunks, form an avenue with the Chestnuts. The contrast between the habits of these trees was very striking. In the background and on the way to the last of the pleasure grounds were plantations of Rhododendrons, which, if they do not grow so luxuriantly as at Trentham, are evidently quite at home.

I was quite ready to admit at this point that Keele had a right to be content with its good and pretty things, but I had yet to see what will ever distinguish Keele in my mind, i.e., the third and last of our divisions. The first sensation was one of wonder, coming suddenly as we did on the "Great Holly Hedge." The reader must try to imagine a long dark green ridge of Holly, 10 yards thick, and about 25 feet high, closely clipped, with scarcely a break or flaw the whole length. Its evenness for such a long distance is very wonderful. A short hedge, right angles to the main one, has a high archway cut in it. But it is well worth the trouble taken to keep it in such splendid condition, for a Holly hedge of this size does not exist anywhere else, and it is very doubtful if one again could ever be grown to the same perfection. A broad walk goes the whole length of the hedge. At the start on the left, is the Italian garden, a parterre with beds of Pelargoniums and the other usual bedding-out plants, and "relieved from dryness by statuary" (to quote Sir William Temple). The view will give the best idea of what succeeds, and further on comes a broad expanse of lawn covered with Conifers, and here and there groups of choice shrubs. An avenue of Deodars, about 20 feet high, are at the age when they look most beautiful in our climate, on account of their fresh glistening foliage. When exposed to cold winds they soon look sad and weary, but at this stage they are exquisitely pretty, especially in the early morning, when "dew-diademed, they salute the sun." A circle of conical Cupressus Lawsoniana are slightly higher than the Deodars, and this tree also has a bright vivid hue all its own. The fact of their all being of the same height creates the idea that trees must have some sense of rivalry. In a wood they all grow fast to get an equal share of the light; but the same explanation would not hold good here.

Conifers, standing on a lawn as here, and each showing its separate mould and features, produce a very beautiful effect. This effect is still more noticeable with our own indigenous trees when growing in the park; for, as one star differeth from another in glory, so do the trees.

A grass-walk is constructed down the middle of this part of the grounds; at the end, for a considerable distance, is a herbaceous border on both sides. It was as gay and varied as it well could be made. Hydrangeas, Lilies, Tritomas, Phloxes, Asters, Rudbeckias, Helianthus, and other bright flowers, were all glancing in the sunlight. The prevalence of yellow flowers suggested Campbell's lines—

"Yellow flowers of autumn, how beautiful ye are,
Shining from your glossy stems like many a golden star."

As Mr. Wolley Dod and Mrs. Sneyd are great friends, it is only natural that this border should be a great success, for no one could give better advice on its management than Mr. Dod.

The kitchen garden is not large, but it is very well cultivated. The houses are very interesting, and are not merely filled with small Palms and plants for decoration. What a world of contempt some gardeners put into the word "decorative stuff!" The most notable houses are a large lean-to show-house, where the flowers are tastefully grouped; a high conservatory, in which are some specimen Azaleas and Camellias, and two high plants of Fuchsia Beacon, which partly covered the roof at the time of my visit; and a fernery, which, if it had been formed by Mr. Birkenhead, could not have been made any prettier than it is.

The houses for fruit-growing—well, as Mr. Wallis is in charge of them, I need say nothing as to their well doing; that can be taken for granted. I was very sorry that I was too late to see the Peaches, as except some late varieties like Sea Eagle, they had all been gathered. The vineries, however, were at their best for all varieties except Hamburgh. Golden Queen—a very apt name for it—was producing a heavy crop of large perfectly-finished bunches. The deep colour and heavy bloom on Black Morocco was a great contrast to the golden hue of the Queen. A seldom-grown Grape was Muscat Champion; it is said to have been a cross between a Hamburgh and a Muscat, and colour and flavour bear out this idea. It was raised by the late Mr. Meredith. An amusing anecdote is told with regard to this Grape. At dinner one night, a guest remarked to his host, observing a dish of this Grape, "Those Grapes are not ripe, or else they were very badly grown and finished." "They are neither," replied the host. "I have grown Grapes all my life, and I ought to know." "Taste and see," was the host's second reply. The guest did so, and had to confess they were almost, if not quite, the best variety for flavour he had ever tasted. A large Fig-house will soon be entirely filled by one very vigorous Fig. *Vagabond.*

PITCHER-PLANTS AND FRANKINCENSE.

The History of Sarracenia.—Sarracenias are wonderful enough as insect-trapping plants, singular enough in leaf-form, and beautiful enough in their flowers to attract attention from many quarters, but what connection there can be between the Olibanum, or Frankincense of Arabia, and the Pitcher-plants of North American swamps, it is not easy to see. Nevertheless, some of our forefathers seem to have thought there was such a connection, as we shall presently indicate.

The French botanist Tournefort has the credit of having introduced the Sarracenia to the notice of botanists, and although we shall show that something was known of the plants long before his time, we are not going to detract in any way from the merit pertaining to him for having given the first accurate account of the genus accompanied by excellent figures of the flower.

As it is not under Sarracenia that one must look for the early history of the plant, but under "Thus," or under "Limonium," it is only by accident that the student gets upon the right track. When once started, progress is not difficult, and the history is curious enough to interest the plant-lover. We shall, therefore, allude in chronological order, to the history, so far as we have been able to unravel it. The earliest notice we have lighted on is in Pena and Mathia de Lobel's *Stirpium Adversaria nova, Londini*, 1570. In this volume, at p. 430, is a figure, showing two leaves, which are without doubt those of what we now call Sarracenia, but which were then attributed, doubtfully, to the Frankincense tree: "Thuris limpidi folium aiunt." It is expressly stated that the leaf had not been figured previously, and that it differed from others in being double, or made up of two coats from the stalk upwards to the hood, the resemblance to the flowers of Napellus [Aconitum] and Lonchitis [?] being pointed out. We quote the exact words, the meaning of which is obvious, though we do not find it easy to construe them satisfactorily:—

"Rupelle occidui maris quadrienniu fermé est cum doctus medicus Launatus nos gummi istius glebis, arboris fructu et folio donavit. Asserabat nihil tamen, sed sibi relatum a nautis utrinque, trunci Pino similis sobole esse. At folium,

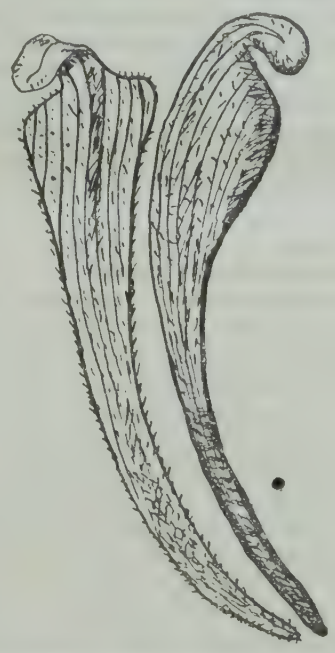

Fig. 2.—"Thuris Limpidi folium L'Obely. The supposed leafe of the bright shining Frankincense tree." Gerard, *Herbal*, p. 1247 (after Tabernæmontanus).

quia valde quàm rarum neque dum ab ullo depictum hic dedimus magis sciscitaturi, sit ne Resiniferæ plante quam asserturi est namque, quod raro contingit aliis, ab imo pediculo, ad summum usque cuculæ verticem, duplicatum quasi ex geminis conflatum, tenuibus tunicis vagina sesquipalmum longa, instar infundibuli, hiantis histrionis speciem præ se ferentis; superne galeata videtur, quod de floribus Napelli et Lonchitide non de foliis ullis memorant auctores."

Fig. 3.—"Thuris folium cucullatum," from Chabræus' *Stirpium Icones* (1666), p. 73; the same figure as in John Bauhin's *Historia*.

In 1575 was published the *Cosmographie Universel*, by Thevet. In the first volume of this work, at p. 119, is an account and a figure showing the mode of extracting the "encens" by means of incisions into the bark, the gum-resin being afterwards scraped off and packed in jars. A Palm tree and some pyramidal trees which may be meant to represent Cypresses or Junipers, are shown in the background, but nothing in the least like a Sarracenia. Thevet, then, the great authority of his time on Frankincense and similar things, is not answerable for the collocation of two such diverse things as the Pitcher-plants and the Frankincense.

In *Dodoens, Stirpium Pemptades* (1583), we have not discovered anything relating to the matter under consideration.

Dalechamp's Historia Omnium Plantarum was published in 1586, and in it we find mention of the "Arbor thurifera Theveti," just mentioned, and a figure of the "Thuris limpidi folium Penæ," the whole copied from L'Obel.

In 1588 was published the first edition of *Jacob Theodor Tabernæmontanus neue Vollkommene Krauterbuch*, an edition of which was published at Basle in 1664, by Caspar Bauhin. In the original edition, vol. ii., p. 642, cap. iii., under the head "Weyrauch, Thus," is a figure showing a portion of the stem of a tree with lumps of gum or resin exuding from it; and, on the right, two leaves, which appear to be those of Sarracenia, but which are provided, probably, from the artist's imagination, with fine hairs. In 1597 the first edition of Gerard's *Herbal* was issued. In this volume, p. 1247, under the heading "Abor Thurifera, the Frankincense tree—Thuris Limpidi folium L'Obely—the supposed leafe of the bright shining Frankincense tree," the same illustration as that given in Tabernæmontanus before referred to is given, and a copy of which we append at fig. 2, omitting, however, the resin-bearing trunk. Gerard gives a translation of the passage in Pena and De L'Obel, which we have cited before. Says Gerard, "Pena writeth that he hath seene the cleere Frankensence called Limpidum, and yeelding a very sweete smell when it is burnt, but the leafe hath beene seldome seene, which the Physition Laumanus [spelt Launatus by L'Obel], seemeth to set out thus, although it be not certain whether it be the leafe of the Frankincense, or of some other Pine tree, yeelding the like juice or gum. It is, saith he, which doth seldome happen in other leaves, from the lower part or foote of the leafe to the upper ende, as it were doubled, consisting of two thinne rinds or coates, with a sheath a span and a halfe long at the top, gaping open like a whoode or fooles cockscombe, and as it were covered with a helmet, which is a thing seldom seene in a leafe, but is proper to Leekes or Lonchitis as writers affirme." As we have seen, L'Obel compares it more appropriately with Napellus.

In Johnson's edition (1636) of *Gerard's Herbal*, at p. 1435, the history given in the first edition is repeated, with a few amplifications. It is pointed out that the Physition Laumanus gave to Pena and L'Obel a leaf, "together with some pieces of the Rosine which he had of certaine mariners, but he could affirme nothing of certainty, whether it were the leafe of the Frankincense, or of some other Pine tree yeelding the like juyce or gum." Johnson also compares the leaves to the flowers of Napellus or Lonchitis; and not to Leekes, as Gerard originally did. The woodcut in Johnson's edition is different from that in the older one; the Sarracenia leaves represented are smaller, and in a reversed position, as if they had been copied from the older woodcut.

It is rather singular that Johnson did not take note of the important account published by Clusius more than thirty years previously; *Clusius' Historia* dates from 1601. In that work, at lib. iiij., cap. lv., p. lxxxij., we find an excellent representation of a plant of Sarracenia purpurea taken from a drawing of a living plant, and showing a tuft of leaves surrounding the remains of the flower-stalk. Clusius having no flower before him did not know exactly where to range these leaves in the system, but referred them to the neighbourhood of Limonium, speaking of the plant as "Limonio congener." Limonium is now what we call Sea Lavender, or Statice, and we fail to see any connection between Sarracena and Statice beyond what arises from their both being found in

muddy (limus=mud) places, like the "Ostreæ limicolæ" of the classical writers. It may be well to cite exactly what Clusius says in the original Latin, a translation of which will be found later on :—

"Peregrina prorsus et elegans est hæc planta cujus iconem et resiccatū folium Lutetia usq ; ad me mittebat humanus vir et diligentissimus Pharmacopoeus Claudius Gonier qui siccam eâ et confracto caule mutilâ Ulysipon, veluti ad me scribebat acceperat. Sunt verò huic plantæ (Claudio teste), folia novem decem aut plura a summo radicis capite prodeuntia quorum forma ab omnium quas unquam viderim stirpium foliis diversa est quia cava sunt, florū Aristolochiæ instar tumente alvo et veluti paleari prædito gibba dorso, infima parte angusto. . . . Natales non indicati neque quo tempore flores det notandum."

The description given by Clusius is accurate, so far as it goes, and, assisted by the excellent woodcut, there is not the slightest difficulty in recognising what we now know as Sarracenia purpurea. Clusius knew nothing of the native locality, and says nothing about Frankincense.

Bauhin's *Pinax* (1623), p. 192, has "Limonium peregrinum foliis forma floris Aristolochiæ;" but Bauhin adds nothing to what was previously known to Clusius.

Parkinson (1640) in his *Theater of Plants*, p. 1235, copies Clusius' figure under the title, "The hollow-leaved strange plant of Clusius." . . . . . "This strange plant hath such strange leaves, as the like are seldome seene in any other that we know growing, for they are nine or ten or more rising from the head of a small long roote, each by itselfe, being small below, and growing greater upwards with a belly as it were bunching forth and a bowing backe, hollow at the upper end with a peece thereon like a flappe and like unto the flower of Aristolochia or Birthwort, and round at the mouth like a half circle full of greate darke purplish veines on the inside; the whole leafe is of a thicke substance almost like unto leather; among these leaves sprang a stalke, but was broken short of, so that what flower or seed it bore could not be observed. This was sent to Clusius from Paris by one that received it from Lisbone in the same manner. But of late, Master John Tradescant the younger found this very plant in Virginia, having his toppe thereon, which he brought home, and groweth with him, which I here shew you with Clusius his figure."

Here we have the first indication of any member of the genus being in cultivation, and that in England, but from what will appear later on, the species grown by Tradescant appears to have been S. flava rather than S. purpurea. Parkinson's account is a paraphrase from that of Clusius, and to it he adds the just remark: "It seemeth to mee that L'Obel's Thuris limpidi folium is this (i.e., Clusius' Limonio congener)."

In John Bauhin's *Historia Plantarum Ebroduni* (Yverdun), 1650, we also find a copy of L'Obel's account, and figures of three leaves, two similar to, but not identical with, those given by Tabernæmontanus and Gerard, and a third, which we see for the first time, and which evidently represents the Sarracenia variolaris of Carolina and the Southern States.

In Chabræus *Stirpium Icones et Sciagraphia* (1666), at p. 73, the three figures just alluded to are repeated. Chabræus' figure is entitled "Thuris folium cucullatum" (fig. 3), and he goes on to tell us that this hood-shaped and beautiful leaf was occasionally brought from Florida. "Speciosum cucullatum et canaliculatum hoc folium, quod e Florida adferri solet, pingunt etiam Adversaria et Thuris limpidi folium inscribunt." The "Adversaria" being, of course, the work of Pena and L'Obel before alluded to. Chabræus goes on to say that his *Icon* was taken from Thevet's book, already alluded to, but Thevet gives no figure of a Sarracenia leaf, nor so far as we can find, any reference to it.

Plukenet, in his *Almagestum* (1696), 72, and in his *Amaltheum* (1705, t. 376), f. 6, figures Sarracenia purpurea; and at t. 152, f. 3, of the latter work, under the name Bucanephyllon elatius Virginianum e limonio congeneris altera species elatior foliis triplo longior, gives a figure of Sarracenia flava. S. purpurea is also figured in the *Amaltheum*, pl. 5, f. 45.

Morison, in his *Plantarum historiæ Universalis* (1680), Part III., sect. xiii., p. 533 (we quote from Bobart's edition of 1699), refers to our plant under the name "Coilophyllum virginianum folio breviore, flore purpurascente, nobis—" and cites the synonyms of Clusius and Bauhin previously mentioned. Morison's specimen was received from Virginia through Banister. Morison is also said to mention in 1680, a Coilophyllum virginianum, longiore folio erecto luteo, a description which applies to S. flava.

We now come to the first adequate publication of the genus, accompanied by excellent representations of the flower. This was in Tournefort's *Institutiones*, tom. i., p. 657, t. 476, we quote from the third edition published in 1719 (the first was issued in 1700). Tournefort describes his Sarracena canadensis foliis cavis et auritis, and goes on to tell us that he named the genus Sarracena [not Sarracenia as usually written], in honour of Dr. Sarrazin, a doctor of medicine, and regius professor of anatomy and botany, who out of his great kindness sent the plant to Tournefort from Canada.

What we now call Sarracenia purpurea was therefore the first of the race to receive a name in modern form. It extends, according to Macoun, from Labrador, Newfoundland and Nova Scotia to the Rocky Mountains, and as far north as Bear Lake, but is quite unknown as a wild plant in Arabia, indeed in the Eastern hemisphere.

In 1756 a summary of existing knowledge on the subject was given in Hales' *Compleat Body of Husbandry*, as follows : — "Leaves long before the flowers were seen in Europe were sent over from America as curiosities ; with these the old English botanists became acquainted, and figured them, though without any account of the flower. They call it in their own language the strange hollow-leaved plant, and after Clusius, who from the imperfect account he had been able to obtain of the herb, supposed it related to the Sea Lavender, Limonio congener . . . . Bauhine supposing it of the Limonium kind, called it Limonium peregrinum foliis forma floris Aristolochiæ. Plukenet, better acquainted with its nature, named it Bucanephyllum, and Morison, Coilophyllum. . . . . That there were two species of the plant was not understood at first, and thence Clusius, by whose means we became acquainted with the plant, suffered some censure. He had received a leaf, and a figure of more leaves, from an apothecary of another nation, Conier, to whom it had come through several hands from America. Our famous Tradescant brought over the other species (flava) from America soon after, and the leaves being much longer and narrower than in Clusius' figure, he was supposed to have given them imperfectly. Since his time we find Clusius was right, and Tradescant's the other species."

We cannot now pursue the matter further, it must suffice to say that we have shown that the Canadian species was known to Pena and de L'Obel as early as 1570. A second species, S. flava, was also brought over and grown by Tradescant before 1640.

A third, Floridan species, was also known as early as 1650.

In some way or another the Canadian and the Florida species became mixed up with the Frankincense trees, and their leaves were supposed to be those of a tree or trees yielding that substance.

Sarracenia, as now known, has nothing whatever to do with Frankincense. The association, such as it is, must be laid to the hear-say evidence retailed by the "physition" Launatus. L'Obel and those who followed him were rightly cautious in repeating his story, but they were good enough also to give illustrations which, as we have seen, push back the history of Sarracenia much further than is generally known. Sir George Birdwood, in his exhaustive paper on the genus Boswellia, in the *Transactions of the Linnean Society*, xxvi. (1871), iii., summarises the history of Frankincense, and of the plants producing it, even quoting Gerard, but apparently overlooking the statement and figure relating to the Sarracenia, as also do Fluckiger and Hanbury.

The first Sarracenia known was, therefore, that which we now call S. purpurea, figured in *Bot. Mag.*, t. 849, and which we have traced back to 1570. It was introduced to cultivation, according to Aiton's *Hortus Kewensis*, by Mr. John Tradescant, jun., before the year 1640.

The second was S. flava, figured in *Bot. Mag.*, t. 780, also introduced by Tradescant.

The third was what we know now as S. variolaris, of Michaux, *Flor.* i., 310, *Bot. Mag.*, t. 1710, and which we have now followed to the time of John Bauhin (1650), but which was not introduced into cultivation till 1803. The other species, most of which have been figured in these columns, are of more recent introduction.

Some of our readers will probably care little for such old-time lore; hence, to bring the history down to our times, we may refer to our monograph of all the species and varieties known in cultivation in our volume for 1881; to Mr. Boulger's paper on the insect-catching propensities of these plants in the same volume, p. 627 ; while for their cultivation, we cannot do better than call the reader's attention to Mr. Baines' communication at p. 280 of the volume for 1878. *M. T. M.*

THE WEEPING SPRUCE.

IT had been my desire for the last three years to visit the group of Weeping Spruce (Picea Breweriana) growing on the summit of the Siskiyou Mountains, in Siskiyou County, California, and having learned this year that the other Conifers in the northern part of the state were seeding, I determined to visit the grove and obtain seed, if possible. In company with my father, Mr. Robert Douglas, of Waukegan, Illinois, we went to Grant's Pass, Oregon, the nearest railroad station to the grove, where we procured horses and drove the first day to Andersons about 20 miles from Grant's Pass. Owing to heavy rains we did not reach Waldo until about four o'clock next day, where we engaged a guide, saddle-horses, and pack-animals, and left for the trees early the morning after, reaching the "Big Meadows," on the summit of the Siskiyous, about four o'clock, having travelled about 21 miles in a horizontal direction and more than 1 mile in altitude. Waldo is about 1500 feet above sea-level, and our camping-place was about 7500 feet. The trail over which we came was made by a Spanish packer for the transportation of provisions from Waldo, Oregon, to Happy Camp, a mining town in California. It is a fair trail for such a rough country, but it is not a macadamized road. We slept that night with some evergreen boughs under us and the blue sky over us part of the night, and the most dense fog I have ever seen for the remainder of the night.

The next morning we walked up the trail about a mile and a half to the few scattering Weeping Spruces, about sixty in number, which had attained a height of 25 feet, at which size they begin to bear seed ; but we found that most of the trees under 50 feet had very imperfect seeds. The cones are from $2\frac{1}{2}$ to $3\frac{1}{2}$ inches in length and $\frac{3}{4}$ inch in diameter, of a fine purplish colour. They mostly grow on the extreme top and ends of upper branches. The beauty of the trees far surpassed my expectations. They have the true Spruce form, tall and symmetrical, with horizonal branches, and a beautiful green colour. In their general features they resemble a well-grown Norway Spruce, but their distinguishing beauty is in their long, pliant, pendulous branchlets, which hang straight down from the branches to a length of 6 or 8 feet on the older trees, while they are no larger round than a lead-pencil. They have a stately grace in calm weather, but their characteristic impressiveness is only seen when the long flexible branches are undulating in a light breeze, or streaming before a gale.

The bark of this Spruce is thin, smooth, and reddish in colour; the wood is white, and very tough. The tree felled several years ago by Mr. T. S. Brandegee for the Jesup collection, shows no sign of decay as yet. The largest tree in this grove—if grove it can be called, where the trees are scattered over a space of 50 acres, mixed with Firs and Incense Cedars — we found to be by actual measurement 121 feet 6 inches high,

with a trunk 2 feet 11 inches in diameter 7½ feet from the ground. Below that height the trunk swelled to a much greater size. Other trees were more than 90 feet high, with about the same diameter. My father left for San Francisco on the second day, but as the trees were seeding heavily, I remained ten days longer, and collected 800 lb. of cones, out of which we will get some 20 lb. of fine clean seed, the first, I believe, ever collected. I found another grove of about twenty trees some two miles from this one, but could see very few seedlings in either place. In both groves the trees were growing on the north side of the highest peaks, where the snow lies 15 or 20 feet deep, as the mail-carriers' signs show; and I can therefore believe the Weeping Spruce will be hardy in most parts of the East.

Later in the season I made another trip to these groves to get as many seedlings as I could, and hunt up more trees if possible. Mr. Orrin Russell, who has lived in this part of the country for more than twenty years, and who is exceptionally well-informed, reported that a few Weeping Spruces grew on the Coast-range in Oregon. I visited him at his mines after I had collected and shipped the few seedlings I could find on the Siskiyou Mountains, and in company with his brother, Mr. Joseph Russell, found the trees at the place indicated—on the summit of the Coast-range, on the divide between Cañon Creek and Fiddler's Gulch. This is the first time, so far as I know, that any record has been made of these trees in Oregon. We also discovered a few more about a mile south-west of the first grove. They are widely scattered, and in a dense forest of Firs and Douglas Spruce, and taller than those on the Siskiyou Mountains, but have a smaller trunk diameter. We spent two days collecting the seedlings. Mr. Orrin Russell informed me that he knew of about a dozen trees at the head of Sucker Creek, in the Siskiyous, which I would have visited had I not been prevented by heavy snow. *Thomas H. Douglas, in "Garden and Forest."* [A figure of the cone of this species is given in our volume for 1886, April 17, p. 497. Ed.]

Foreign Correspondence.

SWEET-SCENTED WHITE FORGET-ME-NOT.

Eritrichium nothofulvum, *Gray.*

It was a pleasure for me to see the other day this pretty Forget-me-not advertised in the novelty catalogue of a Pallanza (Italy) seedhouse. But few words of recommendation were given it, and it seems to me that I, who enjoy its beauty in its native home, ought to say a word more in its favour.

Though not a true Forget-me-not, it is a close relation of that old favoured flower, and not to be distinguished from it by a non-botanist. It has the same habit, unrolls its flowers in the same way as a Forget-me-not, and can be cultivated in any way you please. The flowers are a little larger than those of its relation, and of the purest white, being bright like varnish at the same time. The plants grow of all sizes. On dry hillsides, where the rain of our winter has no ground to soak in, it reaches the height of half an inch; and on the bank of the canal which runs through our place, it reaches 3 and even 4 feet, a great bush spreading with long and strong branches. The usual size, though, is about 18 inches to 2 feet, and as such it is prettiest. In January, when the first grass grows on our hills, and the warm sun stirs plant-life anew, then the seed germinates, and the young plant will have to suffer very heavy rains, and many a cold frost. In April and May, it is in bloom, and, like all our flowers, it covers the ground when its season has come. You do not see anything else where it grows, and delicious is its perfume, filling the air after the scorching sun has gone behind the hills. I cannot say whether the scent resembles most that of a Heliotrope, or a Stock, or a Wallflower. But whichever it is, it is very sweet, and I appreciate it most when I take a walk after sunset. While you are gathering Poppies and Batchelor's-buttons walking in the fields, we pick a bouquet of sweet Forget-me-nots and pretty-eyed Nemophilas and Eschscholtzia.

Messrs. Hillebrand and Bredemeier, the introducers, recommend it for cut flowers. I hardly think they could put a better novelty before the gardener and plant-lover. But they have not recommended it for the purpose which I feel sure it will most be put to in England. Of all the countries I have seen, England is the only one in which herbaceous flowers are put to the use which they ought to have. There is hardly a group in any of the parks, public or private, which is not bordered with pretty flowers, perennials, or bulbs. That is where the new white, scented Forget-me-not ought to find its place. It is hardy, and, though an annual, is sure to seed itself, and stay where once put. The many conditions under which it is satisfied here in its home prove that it will do anywhere, care or no care. *Geo. Hansen, Palo Alto, California.*

Washingtonia filifera.

In reply to "W. W.'s" criticism, December 3, p. 677, in regard to the photograph you published of my Washingtonia filifera, I would like to state that my Palm is undoubtedly the true form of W. filifera, commonly called here the Californian Fan Palm, and it is quite distinct from any of the Sabals, of which I have plants of three varieties growing—Palmetto, Adansoni, and umbraculifera; and whereas the petioles of the Sabals are quite free from spines, the plant illustrated possesses both these, and the thread-like filaments which "W. W." states are sufficient to distinguish it from other Palms. The plant in question, and the Sabal alluded to, are about of the same size. The Sabal was planted twenty-three years ago, and the Washingtonia just seven years, so that even if I had any doubts of it, "W. W." has made it quite clear. I might also state that the petioles on the Sabal are persistent, but in the Washingtonias they fall off with age. As regards both Washingtonia filifera and W. robusta, I have what we consider the two varieties growing side by side. Washingtonia filifera does not grow as fast as W. robusta, and the leaves last longer on W. robusta, and are not so filamentous as in W. filifera. The W. filifera has longer stem, and the leaves are larger than those of W. robusta. I quite agree with "W. W." saying one can be made to do duty for the other in a young state, there being very little difference between them. *H. Papworth, New Orleans.*

Sunny Italy.

How glorious it is to spend the winter in Italy. While those at home are experiencing fogs, frosts, and snow, we may stroll under the shade of the Olive trees and Palms, fanned by soft sea-breezes laden with aromatic perfumes, while the golden fruit of Oranges and Lemons hang temptingly in view. Then how unique and interesting in their total newness are the gardens and towns, the latter all along the coast here are built on the steep hillsides, and with their narrow alleys, tunnelled passages, curious gables and corners, give ample material for the brush of the artist.

But at present, thinking it might be interesting to some of your readers, I wanted to say a few words on the large and ever-increasing export cut flower trade carried on along these sunny shores.

The summers here are so excessively hot, that vegetation is literally scorched up, and in the autumn many things present the appearance of having braved the vicissitudes of an English winter, the Roses having only a few yellow leaves on them. The seasons are quite reversed, and autumn means re-awakening, and the autumn rains call all into fresh life.

An English gardener if transported to the flower nursery of one of these southern growers, take that of Messrs. C. Riva & Son, would be somewhat surprised. Away as far as the eye can reach stretches the blue Mediterranean Sea, with the blue, blue sky above; behind, run up for hundreds of feet the steep rocky mountains, the lower parts clothed with Olives. One would never imagine these hills could be cultivated, but centuries have mellowed the softer stones into a soil of fair quality. It is interesting to examine the stones in their various stages; at first it requires a hammer to break some, and finally, when in its last stage as a stone, you can crumble it between your fingers. The hills are so steep, however, that the fertile parts cannot be utilised as Nature leaves them, so man steps in with his art and terraces the mountain-sides. As you gaze up, a series of about forty terraces rise one above the other, until they seem to reach the sky, and the workmen above look like mites. On these terraces are cultivated the Roses, &c., for exportation all over Europe. As may be guessed, the making of such a garden entails much labour and expense; the stones to form the walls have to be quarried, and carried up the mountains by men and mules; then the soil has to be worked to a depth of 5 or 6 feet, to allow the roots of the Roses to descend—their only chance of surviving the summer drought. Huge tanks are also made to catch the rain-water required for the Carnations and smaller plants in summer. Here are grown thousands of Roses, great bushes, which have to be hard pruned to keep them within bounds. September and October are the pruning months, those first pruned giving the first flower. After pruning, the ground is all dug over, the Roses mulched with manure and night-soil, and everything made trim and tidy for the season; save an occasional dusting with sulphur, all that remains to be done is to cut the flowers. As the winter advances, the flowers increase, until mule-loads of Roses, Hyacinths, Jonquils, &c., are brought down from the mountain-sides, and conveyed to the large and commodious packing-rooms newly erected, where busy fingers pack the flowers carefully in papered and wadded boxes, for these flowers go long distances to Austria, Germany, Denmark, Holland, and even Russia. England is also marked for invasion as soon as the new plantations are in full enough bearing to supply the extra demand. A great number of varieties of Roses are grown here; among them are found in large numbers Marie van Houtte, Maréchal Niel, Souvenir de la Malmaison, Safrano, Gloire de Dijon, Madame Bernard, Lamarque, Paul Nabonnaud, Papa Gontier, &c. *James Macfarlane, Ventimiglia.*

The Week's Work.

FORESTRY.

By J. B. Webster, *Fairview, Stangmore, Dungannon.*

Subjects for underwood in game coverts.—In planting coverts for ornament and utility combined, Kalmia in its several attractive species and varieties, is well worthy the attention of the planter. They are, however, rather expensive to be planted in large quantities, but they may be planted with good effect here and there in the form of groups, or mixed with other plants where they can be seen from the walks and drives. I have employed Kalmias as ornamental covert plants for many years, and not only are they quite hardy as well as attractive, but also game-proof, which is another great recommendation. All Kalmias thrive best on a loose open soil, the better if well mixed with peat; but where peat cannot be obtained except at great cost, thoroughly decayed leaf-mould may be used as a substitute for it. Although the species is evergreen, yet when the plants are planted in very exposed positions, some of the species will occasionally shed part of their leaves during exceptionally severe winters; but this never prevents their flowering at the proper season. Amateurs living in suburban villas and elsewhere should grow these plants, as they form nice tidy, compact specimens, that seldom require to be pruned to keep them in shape, and on which account they are exceptionally well-suited for small gardens and the centres of flower-beds. They are likewise suitable for pot-culture, which is another point in their favour, and when placed in halls, or on a balcony, when in full flower, they have a clean, tidy, charming appearance, which never fails to attract attention. The following are a few of the best for coverts and for ornament:—The glaucous-leaved Kalmia, K. glauca, is a native of Canada and different parts of the United States, and was introduced into this country in 1767, and has not only proved to be thoroughly hardy, but it is also one of the freest flowering species. Its contour is that of a compact

round-headed bush, some 20 inches high, well-clothed with leaves of a glossy green colour above, and silvery on the under side. The flowers, which are produced in great abundance, generally appear in April, and are arranged in terminal corymbs of a reddish-pink colour, and as exact in form and outline as if cast in a mould. There are several varieties of this species, the flowers of which exhibit different tints of colour, and as they are all remarkably handsome and require but small space, they are very suitable for planting in the front line of plants of a more robust habit of growth. The bush or mountain Laurel, K. latifolia, is likewise a native of Canada and some parts of the United States, and is said to have been introduced into this country about the year 1734, and it is proved to be hardy in most situations. It is, however, of a larger size than the former species, and in Ireland I have had plants which attained the height of some 6 feet. The flowers are the largest of any of the genus to which it belongs, of a fresh pink colour, and produced at the terminal points of the branches and twigs in the month of June. It makes a remarkably handsome specimen, and is well adapted for planting here and there along the margins of woods where it has the advantage of shelter and sunlight. There is a variety of this species known as K. myrtifolia, and although it is of a miniature size in every respect as compared with the species, yet it is remarkably handsome, and well worthy of a place among ornamental covert plants. It is also well adapted for pot culture, and amateurs can get no prettier little plant for their small gardens. The narrow-leaved Kalmia, K. angustifolia, is a very distinct species from North America, where it is said to be found principally in boggy ground in the low country, as well as in upland districts of that country. It was first introduced into this country in 1736, and has proved to be thoroughly hardy. The finest plants which I have ever grown of this were planted on reclaimed Irish peatbog, and when fully established, it forms a close round-headed bush some 30 inches high. As its name implies, its foliage is of a lesser size than that of any of the former species, of a glossy light green colour, and when loaded with its pretty pink flowers in early summer, it is remarkably handsome and attractive. There are several varieties of this species in cultivation, all of which are very handsome and ornamental. K. var. pumila has a great resemblance to the species in flower and foliage, but is of a less robust habit of growth, and requires less space for its development. The contour of K. var. rubra is similar to that of the species, but the flowers are of a deeper red colour, and on which account, when planted along with others, it shows contrast and variety.

PLANTS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

SWEET-SCENTED FLOWERS.—Where there is a demand for sweet-scented flowers, Gardenia florida and G. radicans, that may be in pots and are full of roots, should receive a top-dressing of rich loam and sheep-dung, and waterings of tepid liquid manure made from one of the many plant foods now in use. Posoqueria grandiflora and P. multiflora want attention at this season, or cockroaches and woodlice will devour the young buds and leaves; if growing in pots, set them on an inverted flower-pot in a pan filled with water, and place phosphorus-paste about for the pests. Posoquerias bloom profusely when planted out into a bed where they can obtain a nice bottom-heat; their long white bell-shaped flowers are useful for many purposes. The plants are gross feeders, and like a well-drained pot or border. The compost should consist of good loam, dry cow-dung, and silver-sand, with a good supply of chemical food. Pergularia odoratissima, so seldom seen in good flowering condition, should be planted into a bed, and the shoots allowed to ramble freely, the delicious fragrance of its Primrose flowers will repay the care given. Give good loam, leaf-mould, and sand, and drain well. Stephanotis floribunda growing in bottom-heat and showing flower, should have abundance of water. Stove temperature should be 60° to 65° by night, 70° to 75° by day; syringe the plants once during the day if sunny, and well damp the floors. A water-tank in the house with hot-water pipes passing through is an excellent contrivance.

FORCING HOUSE.—Continue to introduce fresh plants as required of Freesias (which should be kept as near the glass as possible, and at the cooler end of the house), also Lily of the Valley, Sweet Briar, Azalea indica, A. mollis, Lilacs, Callas, Hyacinths, Tulips, Narcissus, &c. Plants of Toxicophloea spectabile that were grown well in heat during the past season and rested for a time in a cool house, if placed in heat will soon be a mass of sweet white flowers.

CONSERVATORY.—Re-arrange this as often as often as possible to obtain sweetness and freshness; during severe frosts keep the floors as dry as possible. The temperature should be 45° to 50° by night, and 55° to 60° by day, and give air when practicable. Old plants of Luculia gratissima on walls or pillars should be well pruned-in after flowering, and kept rather dry for a time. The American Smilax in borders or boxes allowed to twine itself on strings from the floor to the roof, is very sweet and delicate. The different varieties of scented Geraniums should be well represented, there is nothing more useful.

ZONAL PELARGONIUMS. — When required for decoration during the winter months, they should be grown in 6-inch pots in good loam and fresh horse-dung. If grown, rested, then pushed on in heat in batches of about fifty, they will well repay the trouble. The best varieties for this purpose are John Gibbons, Henri Jacoby, and A. E. Raspail. The temperature should be at night 50° to 55°, and during day from 65° to 70°; give plenty of air on fine days.

VIOLETS IN FRAMES.—The severe weather of the past week has been bad for these. Cover well at night with dry mats, and remove the covering as soon as possible every day. Give air if the weather permits, by wood chocks at the back of frame; shut up early, and cover up early. When the severe weather is over they will require to be picked over.

CHRYSANTHEMUMS.—Take cuttings of these as soon as they can be obtained, and strike in 5-inch pots in a frame or cool-house; make selections of each sorts required to be grown in 10-inch pots for decorative purposes. For early work there is nothing better than Madame Desgranges, white and yellow; Mrs. Geo. Rundle, Mr. Geo. Glenny, Mrs. Dixon, and Elaine. For Christmas-work—Madame Lacroix, Ethel, Julie, Lagravère, and Peter the Great; a good batch of these, grown without training or disbudding, are most useful for house or church decoration. Cuttings taken from young strong plants at the end of June, and struck singly in 6-inch pots, filled with good soil, and a layer of sea-sand on the top, results in splendid little plants covered with foliage to the pots, many of these producing two and three blooms fit for the exhibition-table, and most useful for grouping purposes. When the cuttings have been inserted, place the pots in a frame, and shade well; they will soon strike, and may be placed in the open air in August.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erleigh, Reading.*

OLD ORCHARD TREES.—Where these exist, and have been in any way neglected in the matter of thinning of the branches, advantage should be taken of every opportunity given by the wintry weather we are now getting, and may reasonably expect to continue, by stopping work among the trees in the kitchen garden and on garden walls, to examine and carry out necessary work among these. See that the branches are well thinned-out of the centre of the crown, and any other part where they have become at all dense. The reason for this thinning-out of branches must be obvious to all, as without a free circulation of air and exposure to the sun, the fruit cannot ripen thoroughly, and hence not keep so well. Most of these remarks are as applicable to Plum and Damson trees as to Apple and Pear, and especially so as regards Damson trees, which, if left to themselves, become quite as dense as do Thorn trees, and more especially that now popular sort, Farleigh Prolific, or Crittenden. Trees that have become grown over with lichen should have their stems and thick branches well scrubbed with a stiff brush, and afterwards dressed over with fresh slaked lime and soot, in the proportion of two parts lime, and one part soot, this being sufficient of the latter to tone down the glare of the lime, which might otherwise be considered objectionable. For the stems and larger branches the whitewash-brush should be used, and the same dressing, diluted and passed through a fine sieve, should be applied to the remainder of the tree with a syringe. For trees infested with American blight, since the introduction of the Stott syringe with spray-nozzle, the matter of exterminating this, the most harmful of all pests infesting fruit trees, is now a simple matter, and must be dealt with at once. Petroleum is a sure remedy, and in careful hands may be used with perfect safety in the proportion of half a pint of the oil to 3 gallons of water, great care being taken to keep the mixture well stirred up whilst using it. The "Killmright" insecticide may likewise be used without any risk, in the proportion of 4 oz. to the gallon of water; or, with the Stott syringe, by an arrangement made in the same for holding the insecticide, a second application of the Killmright may be necessary.

YOUNGER ORCHARD TREES.—Trees which may have been planted from eight to twelve years, or even longer, and consequently have now begun to bear fruit freely, should be attended to in the matter of pruning and thinning the shoots and branches on the inside of the heads, so as to keep the latter well open; and also in each case take off one of two crossing branches, and smooth off all sawn parts with a strong pruning-knife. Much assistance may be afforded orchard trees growing in unsuitable soils by top-dressings. Where the soil is shallow, and of a light and hungry nature, top-dress such soils forthwith with clay, or any heavy soil comeatable which the frosts will pulverise, and the earth-worms work, or prepare channels for it to pass down to the roots. But if the soil is of a heavy nature, the top-dressing should be charred soil and burnt garden refuse, a plentiful supply of which should always be in readiness for use in the hardy fruit garden.

THE FLOWER GARDEN.

By T. W. CRASP, *Gardener, Canford Manor, Wimborne.*

LAWNS AND WALKS. — Work in the flower garden is at the present time at a standstill almost; still every opportunity should be seized of doing anything that requires attention, with a view of lightening the work when it recommences. If the weather is not too frosty, the cutting back and thinning the heads of shrubs, especially Laurels, Rhododendrons, Hollies, &c., which are apt to get very unsightly if they are allowed to become overgrown. The branches if cut back to the hard wood will look rather bare for a time, but they will break again very readily in the spring, and a neat and shapely appearance will take the place of their former ragged ones. In mild weather, lawns will claim a share of attention, in the matter of sweeping and rolling, and all weeds spudded out or destroyed by means of one of the weed-killers now sold for the purpose. Care must be taken in using these "weed-killers" not to allow the stuff to fall where it is not wanted, or the lawn may look more unsightly than before. In the event of the turf being very weedy, and the soil impoverished, a top-dressing of sifted wood-ashes, soot, and a small portion of quicklime in powdery condition should be used after the weeding is finished, and the holes made by spudding filled in with stiffish loam, trodden level and firm. Grass-seeds may be sown on turf which is sparsely furnished with grasses in March or April; if sown earlier, it is very apt to be eaten by the birds. The present is a good time to mend gravel walks, frequently rolling them after rain or a thaw. Plenty of attention to rolling at this season will help very much to keep the walks in good condition in the summer-time, by forming a level hard surface.

PROPAGATION OF BEDDING PLANTS.—It will soon be time to commence the propagation of some of the more tender bedding-plants if sufficient cuttings were not taken in the autumn. To obtain the cuttings which will strike easily, it is necessary to place the stock plants or autumn-struck cuttings of zonal Pelargoniums, Verbenas, Heliotropes, Iresines, and others used in summer bedding in an early Peach-house or vinery at work, where in a fortnight growth will commence, when and not previously, cuttings can be taken. These, after suitable preparation, and without exposure in cold sheds, should be dibbled into shallow pans containing friable sandy soil, and placed in a gentle bottom-heat; and in the case of Verbenas, Heliotropes, and Iresines in a close frame, or if in a house, they should be covered with hand-glasses or *cloches*. When rooted, pot them off singly, or box them. As the month advances, seeds of Acacia lophantha, Grevillea robusta, Melianthus major, and Canna indica in variety may be sown in warmth. They require a considerable time to germinate. When the plants are up, pot them off in 60's, or pots a trifle larger than thumbs, eventually shifting them into small 48's or large 60's. The frost kills in most winters a large number of the planted Antirrhinums and Pentstemons, and should no cuttings have been taken in the autumn of these plants, seeds may now be sown in a greenhouse, which if suitably treated when they have germinated, will come into flower as early and be as useful as the old plants would have been.

HERBACEOUS BORDERS.—Where the formation of new herbaceous borders is contemplated, the work may be proceeded with during mild weather, when frost is out of the ground, affording the soil a good coat of manure, and digging it to the depth of at least 12 inches, or trenching it still deeper, and loosening the subsoil, but not throwing it up to the top. It is a well-known rule in planting to set the tallest plants at the back of the border, assuming that it has one face only, and grade the other plants according to the height to which they grow down to the edge, but this rule should not be too strictly adhered to, as an occasional Lily or any other plant not growing very strong when planted at intervals near to the edge of the border not only adds to the effect of the plants at the back, but breaks the formal outline of an evenly graded bank of plants. A good effect is produced at once by setting out herbaceous plants in large clumps, whereas if single specimens of Phloxes, Asters, Eryngiums, &c., are planted in a border, it takes nearly two years before they become conspicuous. Old herbaceous borders and beds should be tidied and made neat when the weather allows, so that the early bulbs and plants, as these come into bloom, will have a nice effect.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Pickering Lodge, Timperley.*

GENERAL REMARKS.—It may be said truly that 1892 was not an Orchid-grower's year, so changeable was the weather, and so very little sunheat. We shall find that a great many of the plants will not have ripened up their pseudobulbs sufficiently to flower so freely this year as we might expect, but the Dendrobiums and Cattleyas have ripened fairly well under the circumstances. We had a very severe frost on December 25, after a week's mild weather, when we had only to keep the pipes in the houses just warm to maintain the proper temperatures at night; following that, we commenced with 15° of frost, and on two nights 22°. The large amount of artificial heat that we were compelled to use was a great change for plants which had hitherto not had a great deal this winter. The new year commenced with 12° of frost, but fine sunny weather allowed us to give air to the houses. As a plant that fills a place admirably at this season, Cattleya labiata vera is a great addition to collections. The flowers afford at the opening of the year as fine a show as May and June can boast of, and too much praise cannot be given it, flowering, as it does, from October to January. There are several forms or varieties of C. l. vera, with light and very dark-coloured flowers, and all are worthy of cultivation when many cut flowers are required. In spite of the variety of colour in this plant, we should welcome more white ones. I should like to draw the attention of Orchid growers to the fact that the recently-imported Cattleya labiata vera, as I find them, have the same complaint as the original autumn-flowering labiata, viz., that if you do not keep a sharp eye on the pseudobulbs which have flowered, and cut clean away the sheath and flower-spike close to the bulb, the spike and sheath will decay, and carry decay to the new leaf and part of bulb. I used to find this to be the case years ago with the old variety, and perhaps this is due to the season at which the plant flowers; but anyone noticing this will find it best to cut the affected parts away, dusting the wounds with lime or powdered charcoal. Keep the plants moderately dry for a time at the roots at this season, but on no account allow any part of it to shrivel, as I find that if once it shrivels, it never does well again. Wetting the stage and the pots will keep the plants in good order for a time, and affording as much air as is prudent by the bottom ventilators of the house in suitable weather, is good for them—ours have never been closed on both sides as yet. The temperature of the Cattleya-house may remain at 55° by night, and 60° by day. Cattleya Bowringiana is another Cattleya to which I should like to draw attention, it being another of the autumn-flowering species, its season extending from the month of October to the end of December. The plant is now passing out of flower, and it should be kept on the dry side, but I am no advocate for a great amount of drying-off being practiced on Cattleyas; what I mean by the dry side is to water the plants once in ten days or a fortnight, according to the kind of weather that may obtain. Keep this species at the cool part of the Cattleya-house until signs of new growth are observed, then remove it to a warmer part, and when in a growing state afford plenty of water. In potting C. Bowringiana, good peat and a little sphagnum should be used, and the plant kept high up above the rim of the pot, as its growths proceed downwards, and very often comes from beneath the previous year's pseudobulb, and sometimes get crippled before they get away.

THE APIARY.

By EXPERT.

THE NEW SYSTEM.—So much attention is now centred on the new system of working hives with two queens, that next season will probably result in an universal trial of its merits. To those bee-keepers who do not feel disposed to go to the trouble, or expense, of making a hive specially for the purpose of experiment, the introducer of the system, has drawn attention to the fact that ordinary storyifying hives can be utilised with little trouble, all that is necessary is to have two body boxes of an ordinary hive devoted to the brood nest instead of one, a perforated division board being fixed in the centre of the lower one, and an ordinary division board in the centre of the upper, to ensure that the queens are kept apart. By this means each queen will be provided with from ten to twelve frames in which to lay her eggs. A sheet of queen excluder zinc should, of course, be placed on the top of the frames in the upper body box, over which the super will be put. It must not be forgotten to give plenty of super room (double the ordinary space at least), or swarming cannot possibly be prevented. The entrance to the hive must be divided so as to make two separate ones, or failing this an addition to the ordinary entrance must be provided elsewhere. Mr. Wells has lately given some useful information as to his treatment of swarms issuing from double hives. This is especially welcome, as the question of what to do when a double swarm issues, weighing 14 lb. or more, so as to restore the former order of things, and get a queen back again on each side of the perforated division, presented difficulties that appeared almost insurmountable. He states that if he is present when the swarm issues, he watches for the spot where the bees intend to settle, and, if possible, captures one of the queens and cages her. When the hive is prepared for returning the swarm, the caged queen is let loose in one half of the hive and the entrance to that portion blocked up. He then lets the whole double swarm run into the other half to which the entrance is open. The bees pass up through the excluder zinc and so populate both sides of the hive, with the result that it is queened as before swarming took place. If one queen cannot be captured as described, these double swarms, having two queens, generally settle in such a way as to show where each one is, by hanging in two lumps or clusters. If this be the case, each cluster should be separately shaken into two skeps. The skeps are then stood on the ground for a few minutes, and if the bees remain in them it may be taken for granted that there is a queen in each, and they can then be put back without trouble. Should this plan fail, Mr. Wells introduces a strange queen, if on hand, to one portion, blocking up the entrance as before mentioned, or failing that leaves a ripe queen cell on one side of the hive, which is also blocked up, and returns the swarm to the other.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Buxted Park, Uckfield.*

WITH the advent of a New Year it will be well to take a review of the work in this department, in order to see how we are to proceed during the coming seasons. Those especially should pause to consider their plans who have to provide a constant supply of culinary vegetables, &c., for a large family, and have but a comparatively small piece of ground to cultivate. It would materially assist young gardeners, and those who have recently changed their situations, if they were to make a plan, on paper, of their kitchen garden, and indicate on it where each and every kind of vegetable and fruit is to be grown, and where it is intended to sow and plant others at the proper season. Having done this, the next thing is to make out the seed-list, and send it in to the seedsman, for the sooner this is done the better will it be for all parties concerned. Seedsmen, as a rule, can more conveniently attend to orders sent in thus early than they can when the press of business comes on; and gardeners, on the other hand, will have their supplies, so that they can sow seeds when they please. Making out a seed list is not so easy as some might imagine, especially for beginners, as there are so many points to take into consideration.

SALADS.—Where a constant supply of these has to be kept up, Endive should now be in readiness for blanching, having been protected from frost by straw, mats, or other means. Until the present frost set in, Cos Lettuce was plentiful in the open garden, but owing to the recent severe weather, this has had to be protected, so that it might be ready when required. Chicory and Dandelion roots should be put into heat to blanch the new growth, which starts on this being done, either lifting and placing in the Mushroom-house, or by covering the plants with fermenting material in the open. Sow Mustard and Cress, to form a succession as required.

HERBS.—Tarragon and Mint are so often wanted in the early spring, long before there are any signs of growth outside, and a few roots should be taken up and planted in pots or deep boxes. If these are placed where a gentle heat can be afforded them, young growth will soon make its appearance. Chervil is also much in request for flavouring purposes, so that a pan or two of this should be sown to succeed that in the open ground. Very little heat will be required after the seed has once germinated, and the pans should be kept as near the glass as possible to prevent the plants from becoming drawn. Basil should also be sown and treated in like manner to that recommended for Chervil.

FRENCH BEANS.—Where these are swelling off their pods, an occasional watering with weak liquid manure will be beneficial, but it should not be allowed to touch the foliage. Those in flower should have a drier atmosphere for a few days, to allow the pollen to dry, or they will not set; but they should not be allowed to become too dry at the root, or red-spider will soon make its appearance. A succession must be kept up by making fresh sowings at fortnightly intervals, or when desired.

SMALL SEEDS.—Where large bulbs of Onions and Leeks are required early in the autumn season, a small sowing of some quick-growing kind should now be made in pans or on a slight hot-bed; the latter is preferable, as the plants will be kept in a more uniform temperature. But these hot-beds have their drawbacks, as the glass must be covered at night to exclude frost, so that the plants often become drawn, and much labour is entailed.

CAULIFLOWER.—There is now such a large number of varieties of this much esteemed vegetable, that with care it may be had nearly all the year round. For very early work, we have found none to equal Early Forcing or Sutton's First Crop. Seed of these varieties sown early in January has usually given us a supply of fine heads in May, or about a month earlier than the Walcheren sown in the autumn and protected in cold frames during the winter. Care must be taken to see that the plants do not receive a check, for if this happens, they often bolt, and are useless.

STORE-ROOM.—In bad weather, see that Carrots, Beet, Parsnips, Jerusalem Artichokes, Potatos, and Onions are looked over, and if there be any signs of growth, remove this without delay from all but the last-named, and spread the roots out thinly. Potatos for planting in the open ground should have a light airy position, so as to cause their growth to be strong and sturdy. If frost is just excluded, it will be sufficient, as it is not well to have the growth too forward so early in the season.

FORCED VEGETABLES.—Keep a supply of crowns of Seakale in readiness for starting, either by having them covered up in the open, or by lifting in mild weather and laying them in till wanted, being careful to protect them from frost. If they are lifted when the soil is frozen on the top, this often pulls off the crown, so that they are of no use for forcing. All small roots of the size of the finger should be saved and laid in soil, to be made into sets for planting later on.

ASPARAGUS.—This should also be taken up, or so covered that in the event of the continuance of the present frost, it can be lifted as required. On no account should the roots be allowed to become dry; for if this happens, they do not start so readily into growth. Asparagus is best forced on a slight hot-bed, without the use of fire-heat, for it is then more tender when cooked. Great care must be exercised in making up the bed, or the roots will get burnt, and it should preferably be made chiefly of tree leaves. A bottom-heat of about 60° F., will be sufficient, the top-heat being afforded by means of dung-linings.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

PLANTS, &C., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

LOCAL NEWS.—*Correspondents will greatly oblige by sending be the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, JAN. 9—Linnean Society.
WEDNESDAY, JAN. 11—East Anglian Horticultural Club.

SALES.

MONDAY, JAN. 9 { Plants and Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY, JAN. 11 { Lilium auratum and other Lilies, &c., at Protheroe & Morris' Rooms.
THURSDAY, JAN. 12 { Important Sale of Tuberoses, Gladioli, Lilies, Palms, Dutch Bulbs, &c., at Protheroe & Morris' Rooms.
FRIDAY, JAN. 13 { Consignment of Ecuadorian Orchids, from Messrs. Charlesworth, Shuttleworth & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36°.4.

Hybrids.

IT is sometimes said by those who are not familiar with a gardener's work that, considering their opportunities, gardeners have contributed relatively little to the advance in our knowledge of systematic botany or vegetable physiology. If this were wholly true, the answer would be, of course, that gardeners have their practical duties to perform, and that the proper fulfilment of these leaves no time or opportunity for anything outside the ordinary routine. But it is not wholly true, and we might cite many names of practical gardeners who have contributed in no slight degree to the advancement of systematic botany. At first sight, it might seem as if physiological botany or the study of the life-history of plants would offer the most congenial and the most accessible opportunities to the gardener who has to pass his life among plants, and daily watch over and regulate their growth.

The true foundation of all physiology, says SACHS, is the direct observation of vital phenomena. The all-important discovery that the food essential to the growth of plants is manufactured or elaborated in the green leaves, was made long before chemists knew anything about either carbonic acid or oxygen. Direct experiment alone showed that gravitation is the cause of the downward growth of the root. "Our best knowledge of the life of plants has been obtained by direct observation not deduced from chemical and physical theories."

But with some exceptions, the study of physiology demands means and apparatus which are not at the gardener's disposal. Minute anatomical investigations, and accurate physical experiments, must continue to be conducted by skilled experts in the laboratory. But whilst this is so, there is ample field for the gardener in the careful observation of the more obvious phenomena of growth, and in the study of the influence of external conditions upon it, and he has abundant facilities for doing some kinds of experimental work. In particular, he can render great service alike to practical gardening and to botanical science by the practice of hybridising and crossing, particularly if he has a definite aim in view, and faithfully records alike the details as well as the results of his experiments. In this department a practical gardener was the first in the field. FAIRCHILD, a nurseryman of Hoxton, raised, about 1719, not only the first hybrid Pink (between D. caryophyllus and D. plumarius), but the first artificially-produced hybrid on record. As the pioneer in this department, FAIRCHILD'S name deserves to be remembered with honour. THOMAS ANDREW KNIGHT and DEAN HERBERT, both eminent practical gardeners, take rank with GÆRTNER, KOLREUTER, SPRENGEL, and other botanists. In later times, NAUDIN may especially be noted as a gardener-botanist, who has specially contributed to the unravelling of the phenomena of hybridisation.

Results obtained with a practical aim only, without direct thought of scientific research, are of course abundantly familiar to all interested in gardening. Here the gardeners have it all their own way, and the results they have obtained are very remarkable. We need not do more than mention the hosts of Orchid-hybrids that have been produced of late years exclusively by the gardeners; but in this connection we cannot overlook the history of the tuberous Begonia, the production of which is certainly one of the greatest feats ever accomplished in practical horticulture.

We have been led to the consideration of this subject by the receipt of a remarkable paper by Dr. MUIRHEAD MACFARLANE, in the *Transactions of the Royal Society of Edinburgh*. In this paper Dr. MACFARLANE carefully details the results of the microscopic examination of the following hybrids as compared with that of their respective parents, viz.:—Philageria Veitchii (a cross between Philesia buxifolia and Lapageria rosea); Dianthus Grievei (D. alpinus × D. barbatus); Geum intermedium (G. rivale × urbaneus); Ribes Culverwelli (R. grossularia × R. nigrum); Saxifraga Andrewsii (S. Aizoon × S. geum); Erica Watsoni (E. ciliaris × Tetralix); Bryanthus erectus (Menziesia empetriformis var. Drummondi × Rhododendron chamæcystis); Masdevallia Chelsoni (M. amabilis × Veitchiana); Cypripedium Leeanum (C. insigne × C. Spicerianum). The Philageria and the Ribes have been described and figured in our columns. The Bryanthus is noteworthy because many amongst them, if we remember rightly, the late Dr. ASA GRAY, have doubted its hybrid origin. The doubt is set at rest by Dr. MACFARLANE'S researches.

With reference to the Philageria, Dr. MACFARLANE thinks its two parents, Lapageria and Philesia, may have had a common origin, and that the two genera as we now know them are the result of adaptation to different circumstances; and further suggests the possibility that sooner or later on the southern Cordilleras an intermediate form may be encountered, similar to the artificially-produced Philageria. Such cases are not unknown among Orchids. "I can scarcely doubt that some of our hybrids are artificial pictures of what once flourished as the progenitors of our present day species."

In addition to the eight seed-hybrids described in his paper, Dr. MACFARLANE has investigated the microscopical structure of the marvellous Cytisus Adami, of which so much has been written. The minute structure proves to be as remarkable as the external conformation, and to afford equal evidence of its composite origin. Dr. MACFARLANE then, contrary to the opinion of VOCHTING, supports the notion that C. Adami is a graft-hybrid, that ADAM'S account of it is correct. There are many points in Dr. MACFARLANE'S paper of the highest interest, both to physiological botany and to practical hybridists and grafters. For the moment we must content ourselves with the mere mention of them, but in the meantime we may say that, had Dr. MACFARLANE'S paper reached us sooner, it would certainly have been included in our review of the publications of the past year as the most important contribution to horticultural science that has been made in the period under review. On a future occasion we may have another opportunity of again alluding to some among the many points suggested by this remarkable record of microscopical work.

THE NEW RAILWAY RATES.—The disturbance in trade caused by the revised tariffs of the railway companies, and the consequent complaints which have reached the Mansion-House Association on Railway and Canal Traffic, have decided that body to hold, early in the new year, at the Mansion House, London (by permission of the LORD MAYOR), a conference to which traders and agriculturists generally will be invited. Meanwhile, the numerous communications which the Association has received are being collated, with the view of ascertaining the effect of the new rates on the trade of the country. The elaborate table given in our number for April 20, 1889, should be consulted with reference to this subject.

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the committee of the above took place at the Hotel Windsor on the 29th ult., Mr. H. HERBST in the chair. Among the special amounts sent in during the last month were the following:—Reigate Chrysanthemum Society, per Mr. J. Brown, secretary, £20; Rugby Chrysanthemum show, per Mr. W. Bryant, secretary, £9 2*s.* 6*d.*; sale of flowers at the Edinburgh Chrysanthemum exhibition, per Mr. Tod, £20; the Midland and Birmingham Carnation and Picotee Society, per Mr. R. Sydenham, £5; from Mr. Harvey, The Gardens, Stanton-in-Peak, Bakewell, per Mr. Bolas, £2 10*s.*; collecting boxes, Mr. H. Herbst, £3 10*s.*; Mr. G. W. Cummings, the Grange Gardens, Carshalton, £2 6*s.*; Mr. William Marshall, £1 7*s.* 3*d.*; Mr. C. Gibson, The Gardens, Morden Park, 18*s.*; Mr. A. Waters, Hopwood Hall, Middleton, 15*s.*; Mr. R. Scott, Bradford, 5*s.*; Mr. A. Read, Grittleton, Chippenham, 5*s.*, making a total of £61 19*s.* 1*d.* Hearty votes of thanks were passed to each of the foregoing. The secretary, Mr. A. T. Barron, reported that six applications on behalf of children qualified to receive the benefits of the Fund had been received in answer to the advertisements, and this number added to the nine unsuccessful ones of last year, brings the number up to fifteen, from which eight have to be elected. The rules of the Fund provide, that in the case of one of last year's candidates having died in the interim, the votes received at the last election by the deceased child can go to another of the family, if one be qualified. It was resolved that the annual general meeting and election of children should take place at the Cannon Street Hotel on Friday, February 3; and the committee will meet on the 20th inst., instead of the last Friday in the month, to make the necessary arrangements. Various cheques were drawn, including one of £159 5*s.*, the allowance to children for the first quarter in the new year.

DR. NEWBERRY.—From *Garden and Forest* o December 14, we learn that Dr. JOHN STRONG NEWBERRY, Professor of Geology in Columbia College, died at Windsor, Connecticut, in his seventieth

year. In 1855 Dr. NEWBERRY, in order to gratify his taste for science, obtained an appointment as Acting Assistant-Surgeon in the United States Army, and accompanied the expedition under Lieut. R. S. WILLIAMSON which explored the territory lying between San Francisco and the Columbia River, acting as surgeon and geologist. In 1858 he was attached in the same capacity to the expedition which, under command of Lieut. J. C. IVES, made the first exploration of the basin of the Colorado River of the West. In 1859 Dr. NEWBERRY explored

FIG. 4.—KEELE HALL; LAKE AND VIEW IN THE GROUNDS. (SEE P. 10.)

e country bordering the upper Colorado and San ian Rivers, and during the war of secession ren- red important service to the army as a member of e United States Sanitary Commission. In 1860 published a catalogue of the flowering plants and rns of Ohio, but his most important contributions botany are found in the sixth volume of the *cific Railroad Reports*, in which is printed his port of the plants collected on the WILLIAMSON pedition, with remarks upon the geographical tany of the region traversed, followed by a descrip- n of the forest-trees of northern California and egon, a paper which contains the fullest and most act information upon these trees which has yet been published. Professor NEWBERRY's service to botany is commemorated in Newberrya, a genus of leafless Ericaceous plants, dedicated to him by TORREY, which he discovered in the Cascade Mountains of Oregon.

ANCIENT SOCIETY OF YORK FLORISTS.—The annual dinner of the Society was held on Dec. 21, at Harker's Hotel. Alderman Sir JOSEPH TERRY, J.P., presided, and was supported by Mr. J. G. BUTCHER, M.P. (senior member for the city), and many other influential gentlemen. This long-established association now numbers 600 members, and has a favourable balance of something like £180.

THE ROYAL GEOGRAPHICAL SOCIETY has begun the publication of the *Geographical Journal*, the first number of which has just appeared. This journal, while retaining the official and responsible character of the old *Proceedings*, will contain several new features, which should render it the most popular, as well as the most authoritative, geographical publication in the English language. The greatest interest of its readers will, for many years to come, be centred in the narratives of adventurous or scientific travel told by the explorers themselves at the evening meetings of the society. These will be published in full in the journal, with the discussions which take place after the papers are read. Many of these papers will be illustrated from photographs and sketches made by the explorers. Original maps compiled from the observations and measurements of travellers, will be a prominent feature of every number, and small block-maps will be introduced freely in the text. Papers on scientific geography by the leading physical geographers in the world will occasionally be published. Applied geography, i.e., the practical aspects of the science, relating to such important interests as commerce, industry, communications, colonisation, and agriculture, as well as to the public events of the day, will receive adequate attention. The journal is, of course, primarily scientific. The utmost care will be taken to avoid any national exclusiveness. The society has in the past honoured distinguished explorers of every nation with perfect impartiality, and the journal will record the geographical work of the world in a similar spirit. Under the head of the Monthly Record will be given a series of short carefully-selected and classified notes and comments

on matters of general geographical interest. The notices of geographical literature of the month will give a brief non-critical summary of the additions to the library, including not only books, but also all the important articles in British, colonial, and foreign geographical publications. New maps, atlases, and photographs added to the map room, will be dealt with in the same manner as new publications. Correspondence on geographical subjects will be encouraged, and free interchange of opinions on contested points invited. The *Geographical Journal* will appeal, therefore, not only to geographers, but to all interested in public affairs, commerce, colonisation, foreign missions, in literary work, and especially in education. Its offices are at No. 1, Savile Row.

"A HANDBOOK TO THE FLORA OF CEYLON."—The first part, about to be published by Dr. HENRY TRIMEN, M.B., F.R.S., Director of the Royal Botanic Gardens, contains a full account of all the native plants found in the colony which are members of the Natural Orders from Ranunculaceæ to Anacardiaceæ inclusive; and is illustrated by twenty-five coloured plates, representing some of the most interesting species. The publishers are Messrs. DULAU & Co., 37, Soho Square, London, W.; and the price is £1 1*s*. It is intended to publish the book at intervals, in four similar parts, and it will, when complete, consist of two volumes of text (in 8vo) and an Atlas of 100 coloured plants (in 4to). The subscription price for the whole work, in one payment in advance, is £3 13*s*. 6*d*., and subscribers' names should be sent at once to the publishers in London or to Dr. TRIMEN, at Peradeniya. This *Flora of Ceylon* is issued under the authority and with the assistance of the Government of the Colony, and has been written with special reference to local use; one principal object being to enable observers to ascertain readily the name of any tree, shrub, or herb they may meet with growing wild in the country. For this purpose copious analytic keys and full descriptions are given; as well as the Sinhalese and Tamil names, the distribution of each species through the Island, its period of flowering, and varied information as to its history, properties, and uses. An endeavour has also been made by references and quotations to embody all previously published information on the botany of Ceylon, so that the book will form a comprehensive work of reference for everything relating to the plants of the colony.

THE COLOURING-MATTERS OF LEAVES.—Herr N. MONTEVERDE in the *Ann. Agronomiques* (xviii., pp. 268—270), discusses the interesting question of how many different pigments are contained in an alcoholic solution of chlorophyll extracted from the leaves of plants. We note that he has obtained from dead leaves the pigment carotin which occurs largely in the Carrot. He confirms BORODIN'S observation that leaves contain xanthophyll in their chlorophyll. The etiolated leaves of Wheat contain only very small quantities of carotin; but after a short daily exposure to light, crystallisable carotin can be obtained from them. Both carotin and xanthophyllin exist in the yellow autumnal leaves of many ligneous or woody plants. From the leaves of Scrophularia nodosa, MONTEVERDE has extracted a third pigment, agreeing with the "golden-yellow" of BORODIN. The young leaves of Potamogeton natans are yellow-brown, the colour cells containing, in addition to the yellow and green pigments, a red one, which disappears later on; when dissolved in alcohol, it gives the solution a cherry-red colour. By careful treatment MONTEVERDE succeeded in isolating a beautiful green pigment, and in demonstrating that KRAUS' cyanophyll is composed of this pigment mixed with carotin. He also noticed what he terms an "inferior green pigment," "inferior chlorophyllane," and "inferior phyllocyanin," and came to the conclusion that the first of these exists only in living leaves. Altogether the chlorophyll pigments in leaves seem to consist of a rather complex mixture.

TECHNICAL EDUCATION.—A course of a dozen lectures was delivered on the "Action of Manures," at Aldbrough, Hull, by Dr. J. CLARK, of the Yorkshire College, Leeds, under the auspices of the East Riding County Council. On Thursday the 22nd ult., the lecture was devoted to the action of manures on garden vegetables. The lecturer dealt more particularly with the action of farmyard and artificial manures upon Peas, Beans, Cabbages, and their allies, Onions and Leeks. Special attention being paid to the *rôle* played by phosphates and potash in the plants. The lecture was illustrated by the limelight, and there was an encouraging attendance of eighty-six in spite of the inclemency of the weather. Mr. J. W. FELL acted as Honorary Secretary.

ROYAL BOTANIC GARDENS, GLASNEVIN.—Under the management of Mr. MOORE, says the Official Report of the Science and Art Department, the gardens maintained during the past year their position as one of the principal centres of scientific horticulture in the United Kingdom. The continued interest in the operations carried on there is amply testified by the support which plant growers still afford by their contributions of novelties. It was hoped that the public would have taken more advantage of the sanction of My Lords to the delivery by Prof. JOHNSON of courses of lectures on Botany in the gardens during the past year, but as yet public interest does not appear to be sufficiently aroused on the subject. The morning lectures on Botany, which used to be delivered by the late Prof. WM. HARVEY many years ago, are still vividly remembered by some, at least, of those who used to attend them, and in spite of the great migration which has taken place in the last twenty years from the north side of Dublin, it seems possible that a fair measure of success might again attend lectures delivered under similar circumstances. Mr. MOORE, keeper of the gardens, reports as follows:—

"*Conservatories.*—The conservatories are in excellent order and repair. The addition to No. 1, the desirability of which was mentioned in my last report, has been made, the glass structure being extended outwards 14 feet over a shed at the rear. The appearance of the house inside has been much improved, and the space gained is a great acquisition. The space between No. 1 and the Aquatic-house, No. 2, was also roofed over, and a shelf erected. A useful little house thus replaces what was formerly a waste corner.

"The Aquatic-house and the entire of the curvilinear range, with the exception of the central compartment, have been painted inside.

"The large Palm-house, No. 7, has been painted both inside and outside. This was a very troublesome undertaking, both for the gardeners and for the contractor's men, as most of the plants had to be moved to make space for the scaffolding which was put up inside. Owing to the care exercised by the Board of Works' officials and the contractor's workmen, all the scaffolding was erected and taken down again without any accident happening to workmen or plants. The large Palm-house is now in every way in good order, and the plants show no sign of injury from exposure and dryness of the atmosphere, which could not be avoided while painting the interior.

"*Outdoor Department.*—Many important works, alterations, and renewals were last year carried out in the outdoor department. The new works alluded to in last year's report have all proved to be satisfactory. These were, where necessary, added to or altered during 1891. The plants in the herbaceous borders, in the new Pæony border, in the new bog bed, and on the island have all grown well, and the collection of wall plants has been largely added to.

"The 'Grant' collection of Kniphofias, alluded to in a previous report, had hitherto been cultivated in the private nursery ground. As the plants had grown strong enough to divide, a sheltered corner was prepared for them, and all the most distinct sorts were planted out in small beds in the grass, where they will be accessible to the public for notes and comparison, and will, I trust, form a pleasing and useful group.

"The new offices are a great convenience, and greatly facilitate the work connected with the administration of the garden. Much care has been given to the improvement of the library, and a large number of new works have been purchased, as well as works required to complete imperfect sets.

"Two great and pressing wants still remain. Before the garden can be considered complete these must be provided for—

I. A new house for succulent plants.

II. A house for tropical Ferns.

"The necessity for the first of these I have repeatedly urged. I now do so again. In Ireland no such house exists, nor is there a good collection of succulent plants to be seen. Glasnevin is beyond doubt the proper place for such a house, and were it once provided not much difficulty would be experienced in getting together a fair collection of plants to fill it."

HORTICULTURAL JUBILEE.—M. L. G. GILLEKENS, Director of the École d'Horticulture et d'Agriculture of Vilvorde, has just celebrated the twenty-fifth anniversary of his appointment to that position. On the occasion, the professors, pupils, and friends, sent many gifts and expressions of sympathy. M. GILLEKENS is the author of many works on horticulture and agriculture, is an excellent teacher of much originality and knowledge.

ORCHIDS IN BELGIUM.—At the Horticulture Internationale (Director, M. L. LINDEN) we saw in full bloom Epidendrum stenopetalum grandiflorum, Catasetum barbatum, as rare as curious; and Odontoglossum præstans with two fine racemes. M. VAN IMSHOOT has at Mont St. Amand a Brassia, unknown but excellent. The petals were from 10 to 11½ inches long, exceeding even those of B. brachyata. *Ch. de B.*

GRAFTING CHRYSANTHEMUMS.—We have already mentioned the results obtained by M. ALEXIS CALLIER, of Ghent, in grafting Chrysanthemums on to Pyrethrum or Chrysanthemum frutescens (Marguerite), and it may be interesting to give now some further particulars concerning this mode of procedure, which attracted great attention from all at the November exhibition of the Ghent Société Royale d'Agriculture et de Botanique. M. CALLIER is no inventor in the proper sense of the word, for he does but imitate the Chinese growers who customarily employ this system, according to FORTUNE, as noticed by BURBIDGE in the Chrysanthemum, making use also, it is said, of a species of Artemisia. The idea was suggested to M. CALLIER by seeing the great vigour shown by certain Pyrethrums when manured. Pyrethrum being perennial, or at least retaining its stem and branches, it should therefore be beneficial to the grafts of the Chrysanthemum, which should profit by the food stored up by the stock, and especially by the vigour already attained by it at a time when the shoots of the grafted Chrysanthemum are only beginning to move. This vigour represents the work of weeks, months, or even years. In two years the Pyrethrum, highly cultivated, forms a small bush. In the South of France, where it grows in the open ground, and survives the winter out-of-doors, very large plants of it may be seen. The variety, Etoile d'Or, recognisable by its beautiful flowers, which resemble those of the large yellow Marguerites which, during winter, are sent from Nice and Cannes, is the best stock for grafting upon. Next in order of merit is another variety with large white flowers, which is also grown along the Corniche. The results obtained from these were very similar. Experience will doubtless show us that certain Chrysanthemums have more affinity with certain varieties of Marguerite than others. In the first experiments of M. CALLIER, all varieties of Chrysanthemum did not appear to lend themselves equally well to grafting, as far as had been tried. He succeeded well with the following:—Val d'Andorre, Paul Fabre, Ernest Fierens, Mélanie Fabre, Etoile de Lyon, Hiver Fleuri, Mdlle. Paule Dutour, Madame Eliza Neyd, Source d'Or, Cinna (seedling of 1891),

Cavour, Marie Fierens, Sirius, Hermann (all also seedlings of 1891). The following varieties were not successful:—Mrs. Parnell, George Glenny, Mrs. Dixon, Edwin Molyneux, Mrs. Haliburton, Vital (seedling, 1890), Massalia, Maiden's Blush, Osaka, Guernsey Nugget, Madame C. Audiguier. Even with these the union was effected, but was afterwards more or less a failure, owing to the weak growth of the plant. The La Huart, or La Pontoise, method of grafting was adopted, with a ligature of raphia, covered or not with cold grafting wax. In this method a V-shaped wound is made in the stock, into which the graft is inserted. The union of the stock and graft must be as close as possible, bark to bark, branches of the same size being chosen. The plant should be kept closely under glass for about three weeks, more or less, according to circumstances, and air gradually admitted as the buds appear. The temperature should be 12° to 15° C. (53° — 59° F.) of artificial, 15° to 20° C. (59° — 68° F.) of natural heat. Shade against the direct rays of a hot sun should be given. Grafting may be accomplished at any time from the beginning of December to the beginning of May, according to circumstances and the results desired. Early and late grafting have each their advantages. In grafting early, on a Pyrethrum having but few stems, a very few shoots of Chrysanthemum are enough to produce a large plant by the following November. A plant of Ernest Fierens, grafted in January, 1892, on a Pyrethrum raised in August, 1891, bore only nine grafts, which by careful pinching were made to produce more than 300 flowers. By grafting late—in March, for instance—the operation is more sure and convenient. In this case there is no great care needed, as during the winter months; on the other hand, the Pyrethrum is left to shoot and grow apace like an ill weed, the object being to obtain, by pinching, as many stems as possible. As the growth is much more vigorous than that of the Chrysanthemum, the multiplication of the stems is also more rapid, and in spring the stock is in full vigour and health. At the same time, either by the buds or by allowing the old stools to shoot, as many growths of Chrysanthemum are encouraged as are deemed necessary for the supply of grafts, and these also should attain full vigour. At the proper time—in March, for instance—the stock and graft are both in full vigour, and the ultimate success of the plant is assured. The rapidity of the growth of the Pyrethrum is such that the grafts made in April on cuttings of Pyrethrum grown in January give plants even larger than are obtained from cuttings of Chrysanthemums taken in December. By selecting Pyrethrum of one or two years' growth, and grafting upon it in February or March, a hundred or more grafts, specimens may be produced with one or two thousand flowers, and with a diameter of 10 or 13 feet. To achieve such a result, it is necessary to prepare in advance both the stock and a sufficient number of grafts.

EMPLOYÉS SOCIAL DINNER. — On Friday, December 30 last, the employés of Messrs. DOBBIE & Co., seedsman, Rothesay, N.B., held their annual social dinner. The company consisted of about ninety persons, and included the members of the firm. Mr. CUTHBERTSON, who presided, said that the request which their work-people had preferred during the last year for a Saturday afternoon holiday, and which the firm had been able to grant, though at a pecuniary loss, he believed the firm had no reason to regret.

MR. G. A. DICKSON.—We notice that Mr. GEORGE A. DICKSON, Senior, of the old and well-known Chester firm, has been placed on the Commission of the Peace for the county of Cheshire, having previously, for some years, been a magistrate for Chester, of which city he was Mayor, 1885—1886.

THE DEVON AND EXETER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—Spring Programme, 1893.—Wednesday, January 11, Mr. J. WEEKS, Stoke House Gardens: Subject, "Begonias, Tuberous-rooted, for bedding and for conservatory decoration." Wednesday, January 25, Mr. E. SPARKS, Pynes Gardens: Subject, "Zonal Pelargoniums." Wednesday, February 8, Mr. W. SWAN, Bystock Gardens: Subject, "Orchids." Wednesday, February 22, Mr. W. ANDREWS, Duryard House Gardens: Subject, "Kitchen Gardening." Wednesday, March 8, The Rev. Dr. DANGAR, Principal of the Training College: Subject, "Insects Destructive of Fruit Crops." (N.B.—This lecture will be illustrated by limelight transparencies on a large screen, and may possibly be given at the Training College, Heavitree Road.) Wednesday, March 22, Mr. W. CONNETT, foreman at Messrs. VEITCH's Nurseries: Subject, "Roses." Wednesday, April 5, Mr. A. C. BARTLETT, foreman gardener at Dropmore (son of Mr. BARTLETT, of Knightleys Gardens): Subject, "The Conifers at Dropmore."

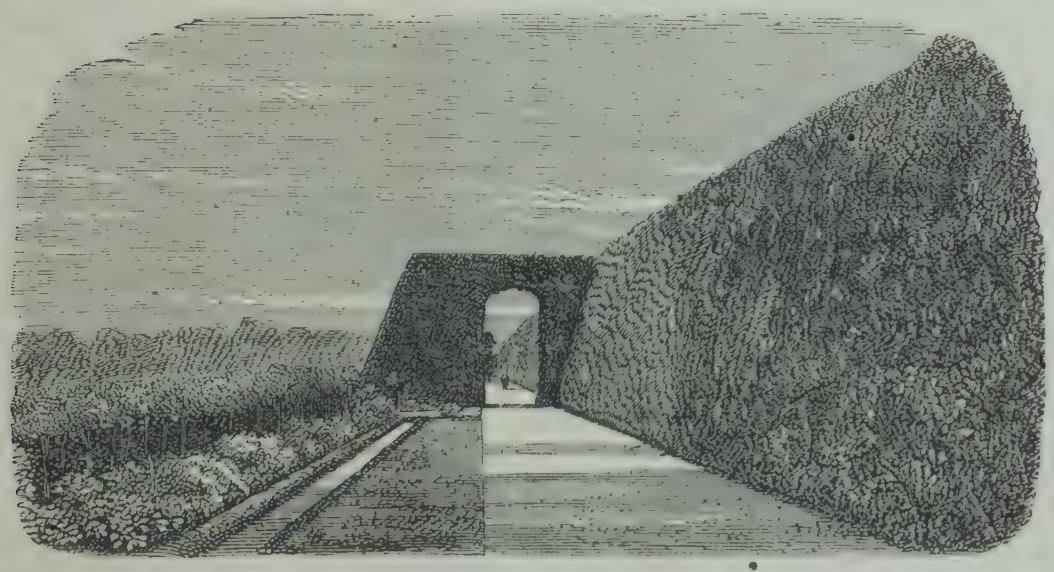

FIG. 5.—THE BIG HOLLY HEDGE, KEELE HALL. (SEE P. 10.)

THE RESPIRATION OF PLANTS UNDER LESSENED OXYGEN TENSION. — The production of carbonic acid gas by plants appears to be independent of the atmospheric oxygen between rather wide limits. Herr STICH has been growing plants in an atmosphere containing less than the normal amount of oxygen, but there was no striking diminution in the output of carbonic acid even when the experimental atmosphere only contained 10 per cent. of oxygen. In the case of many plants, as, for instance, the seedlings of Ricinus communis, Vicia faba, and Lupinus albus, the production of carbonic acid was not appreciably influenced by the amount of oxygen present, and was as great in an atmosphere of hydrogen as in ordinary air. For further details, consult *Biedermann's Centralblatt*, xxi., p. 350.

STRAWBERRIES.—We have received from Mr. A. BRADSHAW, gardener at Davenham Bank, Malvern, two Strawberry fruits—one La Grosse Sucrée, almost ripe, and the other Laxton's Noble, which is much the larger, and less ripe, although it has had a temperature 5° higher. It is rare so early in the year to see such well-developed fruits.

THE PRESENCE AND FUNCTION OF PHLOROGLUCINOL IN PLANTS.—In the course of some recent researches on this subject, Herr T. WAAGE examined no less than 185 different plants. His conclusions are that gymnosperms are rich in phloroglucinol, monocotyledons and gamopetalous plants are poor, whilst polypetalous plants contain none of this substance. Woody plants contain more than herbaceous; the distribution is almost the same in root, stem, and leaves. When cells containing phloroglucinol divide, the new cells contain it also. WAAGE considers that this substance is an accessory or bye-product of plant-growth; it enters into the composition of the glucides and glucosides in the plant, and take part in the formation of certain of the colouring matters. Plants which contain tannin invariably contain phloroglucinol also. The original paper by WAAGE is in the *Ann. Agronomiques*, xviii., pp. 204—206.

CYPRIPEDIUM ALBERTIANUM ×.—This is a cross effected by M. JULES HYE between C. Spicerianum and C. insigne Wallacei. It comes of a good stock, closely similar to that which has yielded C. Lesanum × and C. L. superbum ×. The distal or upper sepal is very large, white, with numerous purple rays and spots, the lower sepal pure white, the lateral petals olive-coloured, with a central purplish midrib, and numerous similarly-coloured spots in the lower two-thirds; the tips are white, the labellum is like that of insigne, brownish-green, shining, and flushed with pink along the free edge. It is well figured in the *Revue de l'Horticulture Belge*.

BEGONIA CINNABARINA (HYBRIDA) VAR. ALBO-VITTATA.—Under this inconvenient name is figured and described, in the last number of the *Illustration Horticole*, t. 165, a tuberous Begonia, with its red flowers marbled and streaked with white. It is a singular and inexplicable fact that the same kind of variation occurs suddenly and simultaneously in widely separated places. Thus, we have seen instances of the same thing during the past summer, and others have been recorded from Belgium and Germany. M. RODIGAS, in describing the plant, assigns it to B. cinnabarina of HOOKER, *Bot. Mag.*, t. 4483, and yet the article and the plate bear the qualification "hybrida," probably by oversight.

STENANDRIUM BEECKMANNIANUM ×.—This is a hybrid between S. Lindeni and S. pictum (alias Eranthemum igneum). Numerous variations were produced as a result of the cross, and one was selected for figuring in the *Illustration Horticole*, t. 166. In it the bright yellow of S. Lindeni is mingled with the bronzy brown of S. pictum. It is named in honour of the raiser.

STREPTOGLOXINIA ×.—The *Illustration Horticole* mentions the production of a bigeneric hybrid between one of the hybrid varieties of Streptocarpus and a Gloxinia. It appears that seedlings are "coming on," but they are not at present old enough to show their characters. To give them a generic name seems therefore almost as doubtful a proceeding as that of counting chickens before they are hatched. M. RODIGAS also tells us that he has fertilised Streptocarpus Kewensis × with the pollen of Isotoma hirsuta, and inversely.

PLANTING ALTERATIONS, ETC, AT SYON HOUSE, BRENTFORD.—A correspondent informs us, that in a walk recently round the pleasure grounds

of this fine ducal place, it was satisfactory to note that Mr. WYTHES is successfully endeavouring to bring into more prominent view its many fine arboricultural features. Huge groups of Laurel and other common shrubs are being cut away, thus giving a greater breadth of green sward for the eye to rest upon, affording also pretty landscape effects, and bringing into bolder relief many fine trees which had previously been hidden from effective view. Groups of Rhododendrons, Weigelas, and other choice flowering shrubs are also being planted in suitable positions.

BOOK NOTICE.

ODOROGRAPHIA: *a Natural History of Raw Materials and Drugs used in the Perfume Industry, intended to serve Growers, Manufacturers, and Consumers.* By J. Ch. Sawer, F.L.S. (London: Gurney & Jackson, 1, Paternoster Row. 1892.)

NOT only is the cultivation of perfume plants an important industry, but the preparation and manufacture of the perfumes themselves is both important and interesting. Piesse and Rimmel have both done good service in popularising the perfume industry in publishing, as they have done, very readable books on the history and development of the perfumery trade; but the subject is such a large one, viewed in all its aspects, and considered in all its ramifications, that there is indeed plenty of room for such a book as *Odorographia*, and it goes far to supply a real want. Piesse's *Art of Perfumery*, a new edition of which was but recently published, appeals more to the general reader in giving an insight to an attractive trade, and imparts just so much information on the sources of perfumes and their preparation as would be required in a book of the kind; but Mr. Sawer's work goes much more deeply into the commerce, trade, and chemistry, not only of popular odours, but also of those about which but little, comparatively speaking, is popularly known, but some of which, at least, may yet become largely developed.

From his introduction, it would seem that Mr. Sawer has made himself thoroughly acquainted, not only with agreeable perfumes, but with those that are to be avoided rather than courted, such as the Carrion flowers (Stapelia spp.), Anagyris fœtida, Arum Dracunculus, Phallus impudicus, the stinkhorn, &c. These do not, however, come in for detailed consideration in the book before us, but as we learn from the preface, that "the author is still engaged upon studies in this department [i.e., odorous plants], and hopes to publish another volume in due course," we may perhaps expect some notes brought together on fœtid plants. As a further proof of Mr. Sawer's capabilities for research into the literature of perfume-yielding plants, we may refer to a list of some ninety odd of the principal works referred to in the book, a list which includes books and journals in most of the European languages. In the arrangement of the book, the author divides his subjects into different chapters. Thus, Chapter I. is devoted to "The Odour of Musk," and after referring to its source, and describing its character and properties, he proceeds to the consideration of Musk substitutes, in which is included such plants as Delphinium moschatum, Sumbul, or Musk-root (Ferula Sumbul), the source of which, though a well-known medicine in this country, was quite unknown till 1869, when the plant was discovered in the Maghian Mountains, south-eastward of Samarkand, from whence one was sent to the Botanic Garden, Moscow, where it flowered in 1871. The following history and description of Sumbul will illustrate Mr. Sawer's mode of treating his subjects. "The plant is," says the author, "a perennial Umbellifer, growing to the height of 9 or 10 feet, and has a branched, fleshy root, about 11 inches in circumference at the base, with numerous rootlets. In 1876 it was reported by Wittman that the plant was found in large quantities in the extreme eastern regions of Siberia, which border on the Amoor river. The word "Sumbul" seems to be employed in Arabic to designate various substances, especially the Indian "Nard," or root of Nardostachys Jatamansi (the true Spikenard), but when or why it was first applied to this root remains an unsolved problem (the word "Sumbul" appears to be an incomplete, or, rather, an abbreviated name). It is known, however, that the Sumbul was first introduced (imported as a drug) into Russia about the year 1835 as a substitute for Musk (which was at that time recommended as a remedy for cholera). It began to be known in Germany about 1840, and in England ten years later. It was admitted into the *English Pharmacopœia* in 1867. The root, as we know it in commerce, is usually cut transversely into slices of from 3 to 5 centimètres, and sometimes 12 centimètres in length, by about 3 or more centimètres in thickness, sometimes mixed with small inferior shoots not thicker than a goose quill. It is covered with a dark papyraceous bark. The internal surface of the slices is pale brown, marbled with white streaks; examined with a glass, an exudation of a large number of resinous drops is noticeable, especially near the circumference. The internal structure has a spongy fibrous farinaceous aspect. It exhales an agreeable odour of musk, and possesses an aromatic bitter taste. Professor Flückiger remarks that the Indian Sumbul root mentioned by Pereira is unknown to him, and that the root imported from China mentioned in Pereira's *Materia Medica* appears to be quite a different root to Sumbul, a fact confirmed by Dr. Dymock, of Bombay, who states that in China the root of Dorema ammoniacum [the source of some of the ammoniacum of commerce], is perfumed with musk, and sent to Europe as Sumbul. Microscopically examined, the internal structure of Sumbul root is very irregularly formed of wood and medullary rays, and the bark consists of a soft spongy parenchyma. The anatomical structure of the root becomes very apparent when a thick slice is moistened with a solution of iodine, the medullary rays acquiring an intense blue colour by reason of the starch contained in them. The irregularity of the structure resembles that of Rhubarb root, but this last has not the large resinous cavities observable in Sumbul root, and in many other Umbelliferous plants. Sumbul root contains about nine per cent. of soft balsamic resin, soluble in ether, and a small proportion of volatile oil (about 0·3 per cent.). When the resin is brought into contact with water it develops a musky odour. A solution of potash is said to convert this resin into a salt of potassium and Sumbulamic acid, smelling very strongly of musk."

The second and third chapters, on the "Odour of Rose," and the "Citrine Odours" respectively, are lengthy, and contain a variety of useful facts; for instance, it may be new to some Palm-growers that the flowers of Chamædorea fragrans have the odour of the Maréchal Niel Rose.

We prophesy that the book will be a valuable one for reference to all those who are practically interested in perfume-yielding plants, but we hope that the author will, in a future edition, make it still more useful, by adopting the latest and most recognised name of each plant, and doing away with all botanical synonymy, except in the case of any one well-known name. The spelling of the scientific names might also be revised with advantage, such slips as Auclandia for Aucklandia, Anethum for Anatherum, Oxycantha for Oxyacantha, hostilis for hastilis, being only too common. We may also appeal for that most necessary adjunct to all books of reference, a more accurate and extended index.

WINTER FLOWERS AT SYON HOUSE.

IN this large garden many species of plants are in flower, notably Calanthes, of which C. Veitchii, C. V. superba, and C. rubra oculata are the finest.

Two houses devoted to Cypripediums present a very gay appearance. The plants are grown "cool," being placed in July in cold frames on coal-ashes facing north or west, and the sashes left off them at night, and plenty of air is afforded during the day. The plants are housed in their winter quarters at the end of September, when they show their flower-spikes. Owing to this kind of treatment, the foliage is very dwarf and healthy, free from all insect attacks, and the blooms, which are of great substance, are produced in large quantities, each plant having from twenty to thirty spikes of flowers. Any dividing or re-potting is done early in the year, and small pots are used—8 to 10-inch for large plants. The varieties grown at Syon are C. insigne, C. i. Maulei, and C. venustum.

Some plants of the old favourite, Lycaste Skinneri, were exceedingly well-flowered. Carnation Winter Cheer, with its scarlet-shaded flowers, is much esteemed, the plants being vigorous, dwarf, and floriferous. A fine quantity (two houses full) was noted in flower of a new late decorative Chrysanthemum named Duchess of Northumberland. It is a sport of the Japanese type, has pure white flowers with a sulphur-yellow centre, and is wonderfully free-flowering. The almost indispensable Eucharis amazonica is grown in quantity; the plants were in bloom in September, and are now in flower again. These Eucharis are never thoroughly rested, but they are kept cool in the winter.

Plumbago rosea was flowering profusely on a wall. It is found useful for wreaths, vases, and other similar purposes. It was appropriate at this season of the year to see forced Christmas Roses in variety. Bouvardias are grown in quantity, and in all the approved varieties. Mr. Wythes speaks highly of the new variety named Purity. It is very pure and fragrant.

The fogs, when they appear here, play sad havoc with the zonal Pelargoniums, completely destroying the flower-buds—indeed, it has been almost determined to give up their culture, owing to this cause. The good old and useful Tropæolum Ball of Fire, of which we saw some good pot plants, is also a prey to the same disagreeable atmospheric conditions.

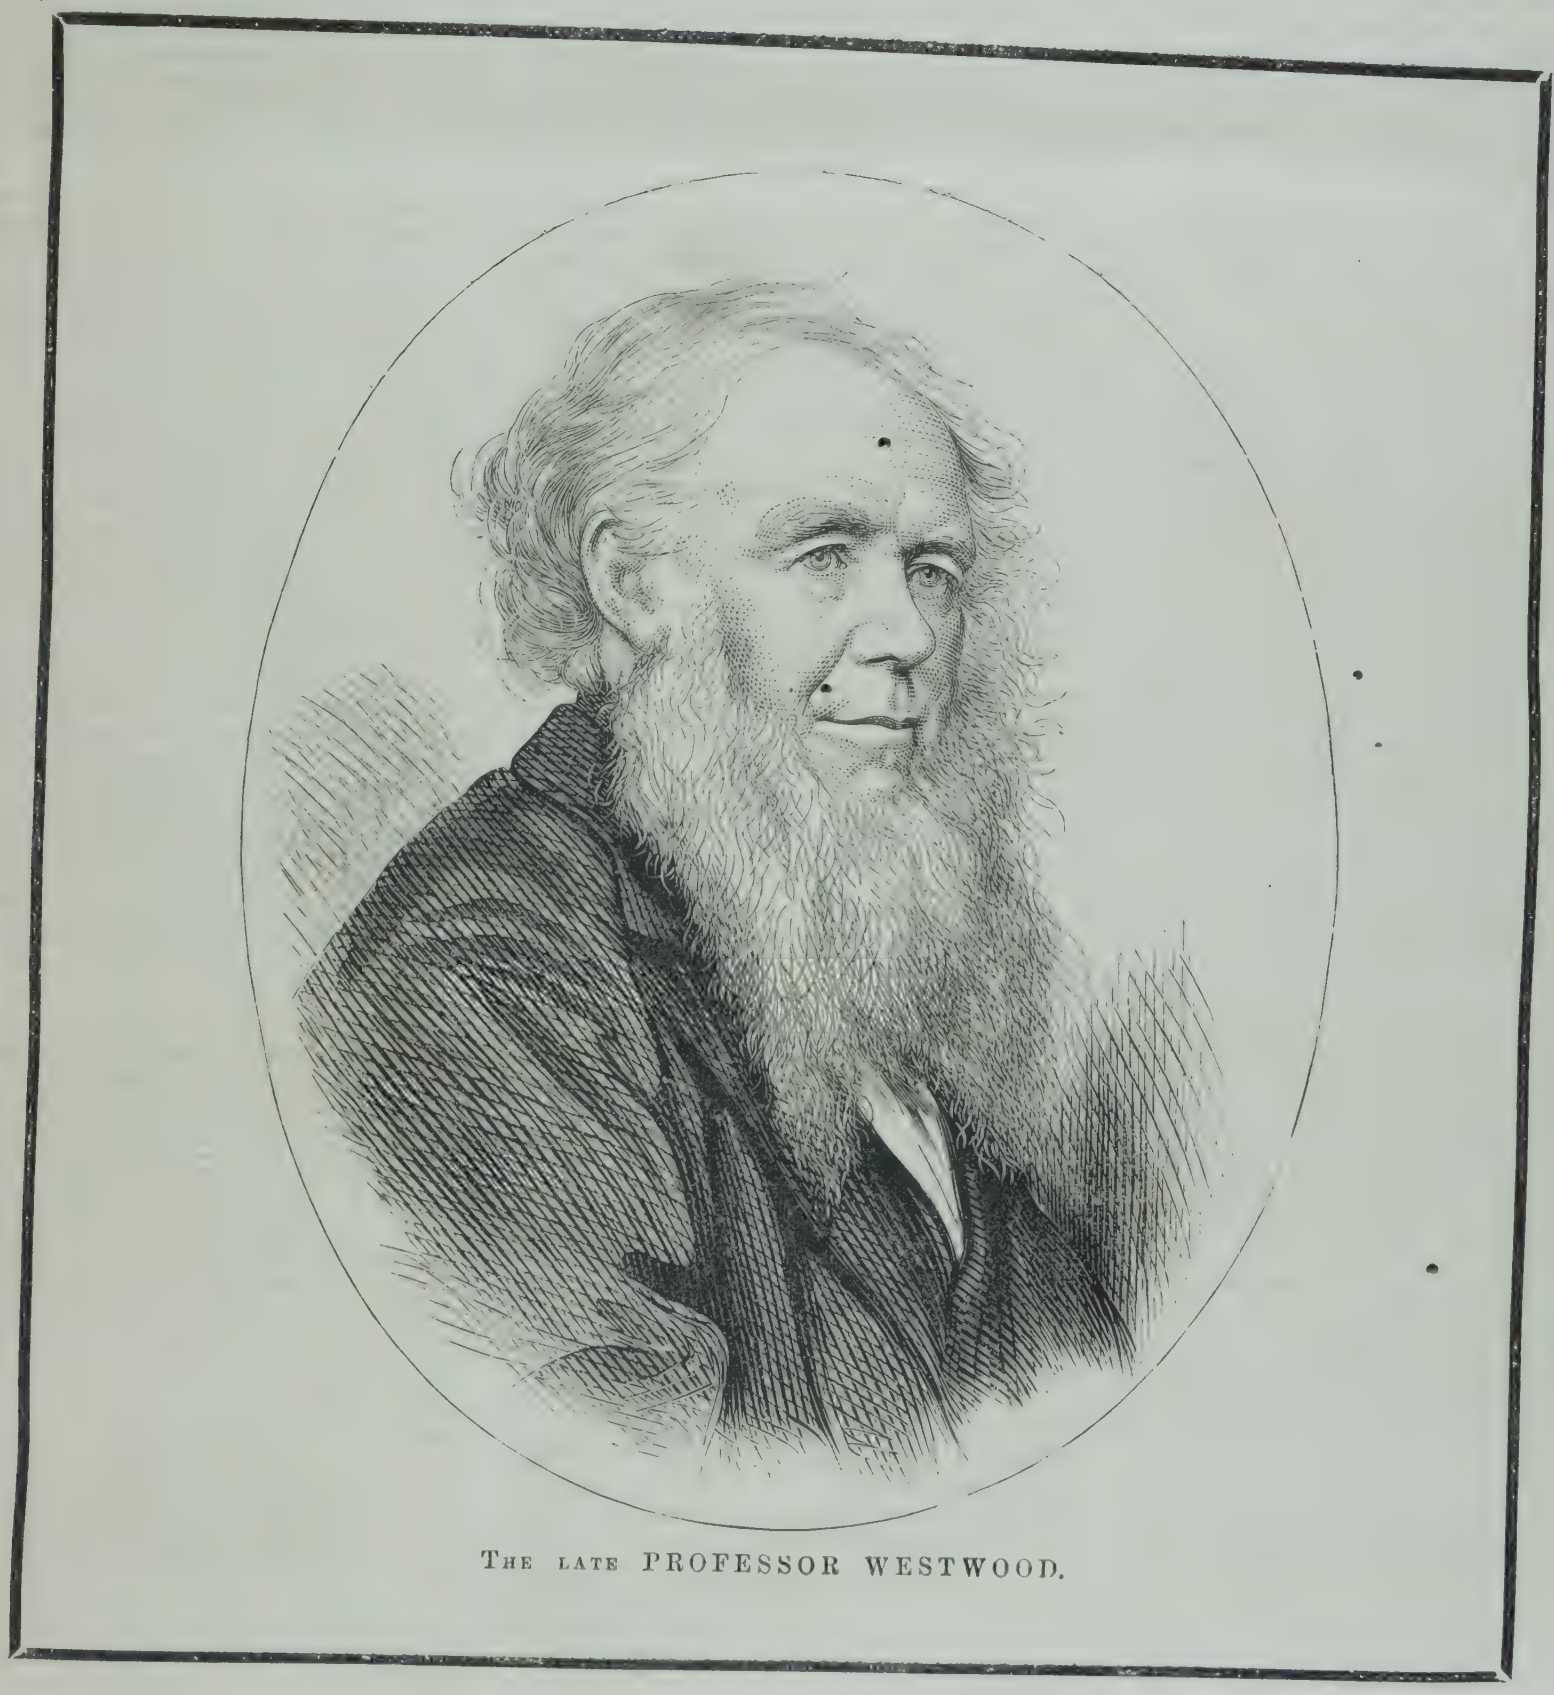
There are no more valuable winter-flowering plants grown than the Chinese Primulas; and a good strain is cultivated here, the flowers being distinct, and varied in colour. The Old Double White is represented by a good batch, the flowers being in much request for cut purposes, as they "last" better than the single forms.

These brief notes may fitly conclude with a reference to that gayest of all winter decorative plants, Poinsettia pulcherrima, which is in much demand at Syon. *J. B.*

Obituary.

PROFESSOR WESTWOOD.—It is only a short time since we had occasion to record the death of H. T. Stainton, a distinguished entomologist, and now it becomes our duty to announce the decease of a yet greater man. John Obadiah Westwood has long held rank as the leading entomologist of this country. His *Introduction to the Modern Classification of insects* is a classical book, whilst his detailed contributions are extremely numerous. A Royal Medal was awarded to him at the instance of the Royal Society, in recognition of his pre-eminence as an entomologist. Westwood was an archæologist as well. Fictile ivories, missals and illuminated manuscripts occupied much of his attention. Since 1861 he has filled the duties of the Hope Professorship of Zoology in the University of Oxford—duties which included the conservation and classification of the collections of insects.

His connection with the *Gardeners' Chronicle* date almost from its foundation to the present time, his last notice being published so lately as December 24, 1892. He succeeded John Curtis as our entomological referee early in the forties, and from that period up to within a few weeks it was a rare thing for a week to have passed without something being submitted to his examination. It would be impertinent for us to criticise the work of so great a man, but we cannot avoid noting one quality which was characteristic of him, and one which we need not say endeared him to the Editors. We allude to his prompt replies to questions put to him. If an insect were submitted to him for a name, an answer was sure to be forthcoming within a very short time.



THE LATE PROFESSOR WESTWOOD.

For the following details we are indebted to the *Times*:—John Obadiah Westwood was born at Sheffield, on December 22, 1805, so that he had just completed his 87th year. He was educated first at Sheffield in a Friends' School, where he early evinced a strong taste for natural history, and a remarkable native gift for drawing. Somewhat later his family moved to Lichfield, where they resided in Parchment Cottage, a house formerly lived in by Dr. Johnson. Here the cathedral with its services had a great attraction for him, and helped, perhaps, to lay the foundation of his taste and knowledge in ecclesiastical art. From Lichfield he went to London and was articled to a solicitor, but though he ultimately became a partner in the firm, he never gave himself to practice, but was more and more drawn off in the direction of science and literature. He was an original member of the Entomological Society, of which he was made life president. But he had another side on which he was equally distinguished. He was a specialist in the archæology and palæography of art. Books like the *Palæographia Sacra Pictoria*, and the *Facsimiles of the Miniatures and Ornaments of Anglo-Saxon and Irish MSS.*, are extraordinary monuments of his combination of knowledge, industry, perception, and skill. In this field, too, he was a pioneer. The

value of works like the *Book of Kells*, and its place in the history of art are now well known. When Westwood wrote and copied, nearly fifty years ago, this was not so. Allied to this was his knowledge of ivories and of inscribed stones. He was employed to make the catalogue of the ivories at South Kensington. His *Lapidarium Walliæ*, one of his later publications, is a monumental work. In the prosecution of his studies he was indefatigable, travelling through Germany or Russia to copy MSS., and keeping up a correspondence with all parts of the globe on points of entomology. In Oxford his hearty and honest disposition, his simplicity, his courageous industry and unflagging devotion to science, sustained long after his eightieth year, his warm kindliness and courtesy, endeared him to old and young. He was fond of relating that when he first came to Oxford some question was raised as to his religious opinion, but all was set at rest by a happy *mot* of the then public orator—that he was not a "sectarian" but an "insectarian!"

HOME CORRESPONDENCE.

APPLE MODELS.—I enclose a cutting from the *Daily News*, which seems to form an admirable text upon which to fashion a short discourse in relation to Apples:—"Of Apples alone it is estimated that there are over 600 varieties in New South Wales, a large number of which are Colonial seedlings of great merit. But, in the opinion of the authorities, it may be safely asserted that there is no one man in New South Wales who could recognise more than one-third of this number. The same may be said in a smaller degree of our Pears and Plums. In order to meet this difficulty to some extent, the Minister of Agriculture has authorised the formation of a collection of models of the varieties of fruit cultivated in the Colony; and to make this collection as complete as possible, the fruit-growers of the different districts have been asked to supply samples of fruit, with the names and details as to their most striking characteristics. The fruit-growers have responded heartily." How great is the need for some such action on the part of the Minister of Agriculture, or other authority here! Those who have been engaged in the work of lecturing on hardy fruit culture will know, when talking of fruit, the exhibition of living samples of varieties adds immensely to the interest the subject creates; but living examples cannot often be had, especially in the winter months, even of Apples. Let the samples be ever so good, soon suffer if carried far and are handled several times. But had all those engaged in this work, good hard, yet perfect models of the best varieties of Apples, Pears, Plums, &c., these would present to the audiences exactly the same characteristics that living fruits present, so far as form, colour, size, &c., are concerned, and would with ordinary care endure for many years. What a splendid opportunity was offered for the securing of fine clean living examples of such fruits at the Earl's Court shows, yet it was no one's business to collect samples and prepare models of them. Probably no private persons or firms have done so much for vegetables in the direction of permanent modelling as have the Messrs. Sutton & Sons, of Reading, for their museum of models is probably the best of its kind in the kingdom. We want one as complete, only public property, of fruits; but that can only be obtained by some public authority, such as the Department of Agriculture, which could, having obtained one complete set of models of the best Apples, Pears, and Plums, duplicate them and sell them to county councils, or any other bodies desirous of possessing them; and these could in turn place them at the disposal of their lecturers, &c., as needed. Drawings of fruits convey something, but models showing life-size are far more impressive. Still farther, these models are useful to enable either us or others following to compare the fruits of to-day with those of some future period, and thus determine how much advance, if any, may have been made. It seems very odd that we should find so much of energy in a matter of this kind in a youthful colony, whilst we at home are all behindhand; but it evidences, that whilst in New South Wales the colonists are alive to their own necessities, here at home there is too much disposition to cry for a slice of the moon, either in the form of a protective duty on corn, or some other impossibility. It is high time we woke up to the necessities of the case. We have no right to expect that the Royal Horticultural Society should undertake work which is so evidently the duty of the Government; but one is surprised that so demonstrative a body as the Fruiterers' Company, or the British Fruit Growers' Association, have not long since forced a matter of this sort upon public attention. *A. D.* [There was once a fine collection of such models at the Royal Horticultural Society, but it disappeared in the bad old times at Kensington. ED.]

GARDENERS' EXAMINATIONS.—In reference to the scheme of the Royal Horticultural Society, will you allow me to throw out an idea or two for bringing more prominently into view the strictly practical element in connection with this endeavour to raise the status of the gardener in this country? Anyone who has watched the progress of events in private gardening matters during the past, say twenty-five years, must have noticed the change that has been effected in, if one may so express it, luxurious horticulture. Do we at the present day see the specimens of plant culture that were observable on every hand in those days? The exhibitions now held, and evidence afforded in other ways, give an emphatic negative to the question. These are the days of utilitarianism and depression, from whatever cause it may have sprung, as a result of commercial losses, change of taste, and other causes which will readily suggest themselves, and need not be inquired into here, have left an ineffaceable mark on the "gentle art." It has been well said that the gardening of the future will be gardening in the fields. How are the rising generation of gardeners preparing for this mighty change? To many a young man it is considered so respectable, and as the height of his ambition, to get in the houses and remain there; and thus we are rearing a race of what have been not inaptly termed "glass-house gardeners," the productions from the kitchen garden being of quite a secondary consideration, and as coming only within the range of the garden labourers. How are such men fitting themselves for the time when they will have to undertake the direction of affairs in this, at the present day, all-important department? The man who can supply good Cabbages, Potatos, &c., for his employer's table, will be more esteemed than the one who only knows how to cultivate choice stove and greenhouse plants. In connection with these examinations, and as having reference to the particular branch of gardening, if some scheme could be devised by which the practical results of the competitor's efforts could be actually seen and appraised in the garden in which he is employed, it would be far preferable to any knowledge gained from mere book-cramming. To refer to one or two other matters. How often are gardeners, when they assume responsible positions, called upon to furnish plans for alterations in the gardens and pleasure grounds under their charge? A knowledge, then, of landscape gardening, &c., and being competent to commit ideas to plans, would seem to be essential qualifications to some positions in a gardening career. Could not the examinations encourage the gardener's efforts in this direction? Greater attention is being bestowed at the present day by owners of estates as to the beautifying of these by the wealth of choice trees and shrubs we now have at our command. Examinations, then, might stimulate a fuller and wider knowledge of arboricultural matters than at present seems to obtain amongst gardeners. *J. B.*

THE GARDENERS' ORPHAN FUND.—The above Institution was established for such a good purpose, and is doing such a great amount of good, that I often wonder how it is that more gardeners do not subscribe, especially as the minimum amount of subscription is so small that it amounts to little more than one penny per week. I believe there are hundreds of gardeners who can well afford that amount, and who might be induced to subscribe, if only asked by some friend who was interested in the good cause. It is a very easy matter to refuse to give a subscription to a stranger, but not so to a friend; at least, this has been my experience, and as I know that every man's influence is limited, and cannot, as a rule, reach far beyond his own immediate circle of friends, I think the idea of forming local committees as suggested by our friend Mr. Crump, a most excellent one. The word "councils" is becoming now so fashionable in towns, counties, and parishes, that we may be pardoned if we called them "district councils;" however, call them by whatever name you like, there would certainly be a vast extent of unexplored regions for them to roam in, and from which a lot of valuable help might be obtained. Take, for instance, my own district, which is a very wide and populous one, and one which it is impossible for any one man to canvass thoroughly, however willing. I believe if we had a committee, "not necessarily limited," but composed of representatives from every part of the district, the small amount I have hitherto been able to send to the fund would be materially increased, the reason for which may very easily be understood when we consider the number of people each committeeman must know and be able to reach in his own district, which it is impossible for any one man, however well known, to approach with the same results. In a society with which I have been officially connected for many years, we have a good working committee, of which four-fifths of the members are collectors of annual subscriptions, each one being supplied annually with a list of subscribers, from whom he is to collect, with a clear understanding that he is not to call upon any other subscribers except those on his list, but that he has a free hand in procuring new subscribers wherever he can; the result being that no subscriber is called upon twice. At the same time, all subscriptions are collected, and should any collector lose an old subscriber from death, removal, or any other cause, he invariably makes it up by adding new subscribers to his list. But the reason why this works so well is, that we are most careful not to introduce new members unless we are satisfied that they mean to be workers. No man should allow his name to appear as a local secretary or committeeman unless he is prepared at least to try and do something for the cause he represents. I know that districts vary immensely in the matter of population and wealth, and that where one produces shillings another ought to produce pounds, but it is a poor one, indeed, that cannot do something. However, as I expect others will have something to say upon the subject, I will simply conclude by earnestly recommending this new idea of my friend Mr. Crump's as being a matter worthy of the very serious consideration of the committee, whom I feel sure will gladly welcome any new departure that will be at all likely to augment the funds; and I, like Mr. Crump, will gladly avail myself of any new opportunity that can be afforded me in the way of adding to the very modest amount I have hitherto been able to send. *J. Hughes, Birmingham.*

A GOOD EARLY PEA.—Noticing several remarks on varieties of Peas, I venture to add another to the list in the form of Sutton's Bountiful, which is well worthy of a trial, and is especially good on light soils. I have not tried it on heavy ones, but I think it would answer, as it has a strong constitution, and is a heavy cropper, and much larger than the majority of early Peas. I sowed a row beside another of William I. the last week in January last year, both receiving the same treatment, and both withstood the severe weather experienced in the following month. The former was only a week behind the latter, and the well-filled pods were thought a great acquisition. I have mentioned the nature of our soil because a great deal is due to the soil in the cultivation of Peas. *W. G. Castle, Latchmere House, Ham, Surrey.*

SCOTLAND.

THE OSWALD HOUSE ORCHIDS.

THERE are so many interesting and rare Orchids in Mr. Buchanan's collection, that it will be better to describe them by genera, and not by the houses they happen to be in. Among "the curiosities" in flower, the fragrant Pilumna nobilis, Bulbophyllum Lobbii, Thunia Marshalli, sepals and petals white, yellow centre; Dendrochilum glumaceum, graceful drooping spike; Lily of the Valley Orchid; Restrepia antenniferæ, the three segments of perianth maculated and coloured identically, and two of the long antennæ, or tapering globular points, forming a St. Andrew's Cross. Rare and noteworthy Cypripediums are C. Sedeni, C. longifolium, C. Harrisianum, C. Chamberlainiana, C. species, oblong spots; C. niveum, C. Spicerianum, and C. cardinalis are in flower, the lobes of the lateral sepals of the former often curving back so as to

meet. Of the Oncidiums, O. ampliatum majus, the winter-flowering O. incurvum, and O. Sprucei have become fine healthy specimens; much larger as regards size are the two Dendrobes, D. fimbriatum oculatum and D. formosum giganteum. All the finest of the Lælias are grown, including L. superbiens, L. Schroderi, L. purpurata (a splendid form of it), L. anceps stella, and L. a. Hallii. Cattleya Lawrenciana, a variety of darker purple than usual; C. crispa superba, C. Sanderiana (a large plant of it) are perhaps most worthy of mention; C. Buchananiana is in the way of C. Percivalliana, but is larger, and of lighter shade of colour. Odontoglossum Pescatorei is grown in quantity; Mr. Wood evidently finds no difficulty in growing this Orchid. Two rare and valuable Odontoglots are O. brevifolium and O. Wilkeanum pallens. A spray of the former was sent to Mr. Sanders for Reichenbachia. There is also a distinct form of Uro-Skinneri with broader petals and deeper purple blotching. Some of the Vandas were 5 feet high. Six Angræcum sesquipedale filled the front of a stage. Large Cœlogynes and Cymbidiums are common enough, but the specimens here were really of unusual size, Cœlogyne flaccida and C. gigantea, and Cymbidium Lowii, C. giganteum, and C. eburneum all being represented. *Vagabond.*

IRELAND.

THE LOUGH NURSERIES, CORK.

The nurseries at Cork cover an expanse of 60 acres, and extend to the shores of the Lough, from which they derive their title, have long maintained a place of celebrity among the centres of fruit and floral production in Ireland.

It was in the year 1776 that the late Mr. Richard Hartland (grandfather of the present proprietor), with Arthur Young, first came to Ireland with the view of commencing the industry of which these nurseries are the centre. He enjoyed the favour of George III., and got appointed over "The White Knight's" estate of 100,000 acres, and then began those operations of forest and glen planting which have done so much to enhance the natural beauties of Ireland, to increase its timber resources, to provide covers for birds, and to open up the branch of work which it has been at all times the aim of the Hartland family to promote and extend. The present Mr. Hartland joined his father at the Lough Nurseries.

Of the extent of forest trees here developed an impression may be conveyed by the fact that in one kind alone, namely, Larch Fir, Mr. Hartland maintains a stock of 5,000,000. Here and there, at various parts of the grounds, are glasshouses, in which many of the rarest flowers and plants are being nurtured, while Roses, Begonias, Pelargonia, Camellias and Azaleas, Chrysanthemums, stove and greenhouse plants, and Coniferæ everywhere luxuriate. The proprietor's dwelling-house is encircled by flowers, and derives a feature of pleasing picturesqueness from such bright surroundings. Directly in front of the house is the far-famed Weeping Beech, whose pendent branches cover 300 feet. It commands the admiration of travellers and tourists, and probably the next feature of attractiveness is the grove of no fewer than thirty golden variegated. Wellingtonias 25 feet high.

In scarcely any department of fruit-growing has Mr. Hartland attained more pronounced success than in the growing of Plums, and for fruit-growing generally he has been the recipient of many prizes. At a recent Plum exhibition in Edinburgh, of the one thousand dishes put forward from the three kingdoms eighteen varieties from the Lough Nurseries were awarded "Extra Merit." The Royal Horticultural Society in Dublin awarded a special Silver Medal for a hundred dishes of home-grown Apples, Pears, and Plums; and the fact thus brought prominently before the public, that Ireland could produce fruit of a very superior quality came as a revelation to pomologists, hitherto unconscious of the prolific character of that country's soil, and its natural advantages for the development of all kinds of fruits. Among Irish horticulturists no subject is of greater interest at the present time than the extension of its resources of fruit and fruit-tree culture, and one has only to glance at the impressive range of productions with which the Lough Nurseries are favoured, in order to find a substantial emphasis of the fact (not so widely known as it should be) that Ireland possesses one of the finest climates in the world for the purpose. At one time in Irish history the south of Ireland was celebrated for its orchards, and, as a natural sequence, for the excellence of its cider, which obtained an extensive sale abroad.

A sum of about eight millions is, we believe, annually expended on imported Apples and fruits, and from this it is evident that, by a successful system of home cultivation, Irish growers would receive a considerable share of this vast yearly output, and at the same time would be promoting the prosperity of an industry largely calculated to ameliorate the present impoverished character of this and other branches of Irish work.

As an ardent collector of everything relative to the industry with which his name is identified, Mr. Hartland has a neatly-fitted apartment, in which he exhibits samples of Apples, Pears, Plums, Peaches, Apricots, Nectarines, Cherries, Strawberries, and Vines. Here also are one hundred and fifty different samples of Irish woods, and a part of the trunk of the famous Cork-wood Tree which grew at Somertown, a few miles from here, and whose branches, previous to its death some years ago, covered a large extent of ground.

A feature of interest to gardeners is presented in the preserved samples of the insects which attack the different trees, plants, and fruits.

GRAFTING ROSES.

This interesting operation is best carried out during the period between November and the end of January, a middle date being, in my opinion, the best. The first item is to have suitable stocks. It would be better if these had already been potted, but it is not yet too late to secure fairly good results. Both the Manetti and Briar are suitable stocks for grafting upon, but the latter needs to be potted some fortnight or so longer than the former, previous to being operated upon. Pot into as small a size as they can be accommodated in, and do not use a rich compost. A mixture in which the roots can work freely is much the best at this stage. I find leaf-soil and loam, with a little sand, makes an excellent compost. It is also advisable not to pot the stocks any deeper than can be avoided, as you are thus able to fix the graft nearer to the base of the roots, and with greater facility.

Many use established stocks; but there is little advantage gained by this, except in the case of working such strong climbing varieties as Maréchal Niel, William Allen Richardson, &c., and which need to make as long and forward a growth as possible. My own plan is to pot the stocks in September or October, plunging them in sand and cocoa-nut fibre, either in a pit or on the sheltered side of a hedge. If this be done at the time mentioned, the stocks will soon plump up again, and their roots commence moving. I do not care for the roots to be too active at the time of grafting, having found that when the tops of the stocks are cut off, and the bulk of the sap is checked for want of employment, the young roots are also severely checked, and often turn brown at their tips. In this case, they do not start into growth again nearly so healthily nor freely as if their roots had not been so forward. If the young roots are about a quarter of an inch long at the time of grafting, it will be quite sufficient, and the sap will be sufficiently on the move to form healthy callus around the graft. A second important item is to use well-matured wood of the previous season's growth. It is also far better if it can be procured from under glass, frost having a very injurious effect upon the callusing properties of Rose wood. In many cases where grafting is resorted to, it is because the variety is a bad grower or scarce, and in these cases it is often difficult to secure really suitable wood.

About a week previous to grafting, I like to get my stocks under cover. These few days cause the sap to move freely, and the roots are just ready to make a corresponding spurt. There are several methods of grafting Roses, but all are on the principle of bringing the severed portions of the scion and stock into as perfect juxtaposition as possible, and to also have both stock and graft in the same stage of growth, preference being given to having the former a trifle the forwarder. I propose briefly describing two processes. First, we have what is known as side or whip-grafting. This is the method most commonly used in grafting other subjects besides Roses, such as fruit trees, shrubs, Camellias, Azaleas, &c. In the case of the Rose, it is desirable to get the scion as near to the crown of the stock's roots as possible. First cut off the top of the stock about 3 inches from the bottom, and with a sharp knife slice off a portion of the wood, starting from the bottom and making the cut deeper as you reach the upper part. More or less of the stock must be cut away according to the size of it and of your graft. If they be of equal size, it is well to cut off two-thirds of the stock as your slanting cut reaches the top. It is usually only necessary to remove a third of the stock. Under any circumstances the two barks of stock and scion should come as nearly in contact with one another as you can arrange. They should also fit, plane, or be true all the way down. In preparing the graft or scion, you make the cut in an opposite direction to that upon the stock, starting from the upper part of the graft. Do not make one of the cuts longer than the other, and fit them together in such a way that the lower portion, or thin end of the scion, very slightly overlaps the bottom part of the cut upon the stock. This is of considerable importance, because the union generally starts from this point. When you have made the two cuts so that they both fit, make a slight downward cut in the stock about half an inch from the top, and a corresponding cut—but in an upward direction—upon the scion. The slight tongue formed upon the latter will fit into the slit of the stock, and hold it in position while being tied firmly together; do not bind them sufficiently tight to constrict the bark in any way.

The second method is usually adopted somewhat later in the season, when the sap of both stock and scion is in full work. It is the best plan for working wood that is only partially ripened; or what professionals style "green-wood." The top of the stock is cut off in the same manner as before, but a trifle closer to the roots, 2 inches being quite enough length to leave. In this case I much prefer to have the stock plunged rather deeply in some moist material like cocoa-nut fibre refuse. This gives a certain moisture and softness to the bark, causing it to lift much easier, and rendering it less liable to split. Make an upward cut through the bark with the point of a knife, and gently raise it somewhat in the same manner as during the operation of budding. Shave the scion down much thinner than in case of whip or side-grafting, and use wood of rather less substance. Now slip this underneath the raised bark, and tie altogether firmly.

In both of these operations it is very necessary to avoid any dirt, and to make the cuts with a sharp knife in as clean and unbruised a manner as possible.

Formerly it was the practice to use a mastic of some kind, both to keep the air from the cuts and to secure from any loss of sap. Now, however, they are simply stood in a close propagating case, and kept dark until callused, and the eyes upon the graft have commenced to grow. When these are some 1 to 2 inches in length, light is admitted gradually; and later on, as the young plants progress, air is also given in increasing quantities until they are able to bear full exposure to an ordinary greenhouse tempe-

rature. A gentle bottom heat of 65° to 70° is very beneficial while they are in the case, but the chief points are to do the work quickly and clean, and to keep them close and dark until a union is effected. *A. P.*

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

DECEMBER 30.—A meeting of the General Committee took place at Anderton's Hotel, Fleet Street, on the above date, Mr. R. Ballantine in the chair. There was a good attendance of members, including the representatives of several affiliated societies. the Secretary brought up a report from the Floral Committee, recommending that as the business of the committee is increasing annually, that the number of elected members be extended from fifteen to eighteen, six to form a quorum, and one-third of the number to retire annually in rota, but to be eligible for re-election; also that a chairman of the Floral Committee be appointed at the commencement of each year. On consideration of this report, it was adopted, and it was also resolved that the General Committee should elect the chairman at their first meeting after the annual general meeting, and that such chairman shall be chosen from the members of the Floral Committee. It was also resolved that no Certificate shall be awarded to any new variety unless the proposal be supported by a majority of the members present.

The schedule of prizes for the three shows, and names of the judges nominated by the Schedule Sub-committee, were also presented for confirmation. The committee offer the sum of £20 for prizes at the Dahlia and Gladiolus Show held by the Royal Aquarium Company. Two new classes were added, viz., one for six blooms of Chrysanthemums, distinct, Madame Desgranges and its sports excluded; and one for a vase, epergne, or stand of Chrysanthemums, for table decoration, the competition in this case being open to amateurs only. Messrs. Gordon and Jones undertook to judge the Chrysanthemum classes gratuitously. The October schedule has also been revised and improved, in a direction calculated to bring a remarkable display of October-flowering Japanese. Two new classes are added; one for six plants of Chrysanthemums, distinct, introduced in 1891—92; and for six blooms of new varieties introduced in 1892 or 1893, not less three varieties to be shown, Mr. H. J. Jones offering a Silver Cup as a prize; and these two classes are also in the November and December schedules. The November schedule is considerably altered and improved, though the leading classes remain untouched. In the class for twenty-four blooms of Japanese, Major Collis Browne, of Broadoaks, Byfleet, gives a Silver Cup, value 5 guineas, as an additional first prize in this class. In the classes for twenty-four and twelve incurved blooms there are now four prizes instead of three as heretofore. Several new classes are added, one for six incurved blooms distinct put into commerce in this country in 1891-92, and another for six Japanese blooms of a similar date. It is expressly stated that no variety which is included in the centenary edition of the society's catalogue can compete in this class. Two new classes are offered for single varieties, one for twelve varieties, three blooms of each, and one for twelve sprays; in each case the varieties are to be distinct. In the amateurs' classes, a new class is added for a hand-basket of autumn foliage and berries, which should make a pleasing feature. In the plant classes, Mr. G. C. Paine, F.R.H.S., offers special prizes for six naturally-trained, large-flowered specimens, the height not to exceed 3½ feet, and there must be not less than twelve blooms on each; Mr. Paine's aim being to see if good specimens less formally-trained can be obtained. Valuable special prizes are offered by Mr. A. J. Godfrey, Exmouth, for Beauty of Exmouth; by Mr. R. Owen, for new incurved and new Japanese varieties of his own sending out; also for fimbriated and fragrant varieties, with a view of encouraging the culture of the smaller incurved and Japanese varieties. Mr. E. C. Jukes offers special prizes for twelve blooms of small incurved varieties, excluding The Queen and Princess of Wales varieties, Lord Wolseley, M. R. Bahuant, Jeanne d'Arc, Prince Alfred, Robert Cannell, or any of their sports, and also new varieties of 1893. The radius for growers competent to show in the metropolitan classes has been extended from 3½ miles from Shoreditch Church, to the area covered by the London County Council. It has also been arranged that the Floral Committee meet on the second day of the November show, instead of on the first, as heretofore. It is intended to issue the schedules of prizes earlier this year than in the past.

LAW NOTES.

IS MOSS PERISHABLE?

IN the City of London Court on Tuesday, before Mr. Commissioner Kerr, the case of King *v.* End was heard. The plaintiffs, Messrs. Beronius King & Co., of 37, Walbrook, E.C., sought to recover the sum of £3, the balance of £12 for certain moss supplied to the defendant, Mr. Frederick End, florist, 28, Wellington Street, Covent Garden.

The Defendant admitted having paid £9 on account of the £12, but he said that after that had been done he discovered that the moss had perished, and was unfit for sale. The plaintiffs had guaranteed that it would last for years. He (defendant) was appointed sole agent in Covent Garden for the plaintiffs; but, in consequence of the plaintiffs subsequently appointing someone else, he (defendant) was unable to sell the moss.

Mr. Commissioner Kerr said the defendant should have raised a counter-claim for damages, or have brought a cross-action.

Mr. Charles Quilter, plaintiff's solicitor, submitted that the defendant, being in the trade, the maxim *caveat emptor* would apply. They told the defendant that if he kept the moss dry, it would last for several years, but if he allowed it to become damp, it would be of no use.

Mr. Commissioner Kerr said he must find for the plaintiffs, and allow the costs of the action.

CACAO.*

THE gradual establishment, under the fostering care exercised from Kew, of botanical gardens in most of our small West Indian colonies is a well-devised move in the struggle for existence which these colonies are fighting. The true function of these gardens is not so much botanical, though a great deal of good botanical work may be, and is, incidentally done by them; nor is it chiefly horticultural, though it is a certain fact that the pleasure gardens, both of the West Indies and of Europe, have derived great benefit from their establishment. The true function is, rather, commercial—to find experimentally what plants, and what varieties of these plants, may be most profitably cultivated; and in what manner, not only these new plants, but, perhaps still more, the already established objects of agricultural industry may most profitably be treated. Among the oldest-established of these gardens are those in Trinidad, which are now under the charge of Mr. Hart, Trinidad being the one island of the West Indies in which cocoa, or, if we must call it so, cacao, shares with sugar the chief place among exports; it is natural that here the work of the botanical gardens, and of the superintendent of these, is chiefly concerned with cocoa, just as, in the neighbouring colonies of British Guiana and Barbados, the analogous interest is chiefly directed towards sugar cultivation. Cocoa to the average value of half a million pounds sterling has, it may be mentioned, been exported from Trinidad for some years past. This being so, Mr. Hart has lately published, in substantial pamphlet form, the information on the subject of cocoa cultivation which has been accumulated not only by himself, but also by his predecessors, and by his colleagues elsewhere. His booklet is indeed a *vade mecum* of cocoa cultivation, and deals fully, so far as present knowledge permits, with such subjects as the selection of the most suitable land, and of the most marketable varieties, the best ways of planting and shading these, of pruning and manuring them, and of the bearing on the subject of the climatic conditions met with in Trinidad; also with the methods of preparation for the market, the cost of production, and the aspects of the export trade; and, finally, with the more scientific sides of the subject—botanical, chemical, and pathological. The book is, in fact, one of several on kindred subjects, the deduction from many practical experiences, which should be readily procurable by those in England, who, from time to time, consider the question of engaging, in one form or another, in tropical agriculture. It seems a pity that there is not some one place in London where all such booklets and pamphlets might be readily procurable; and it may even be suggested that this useful work might be undertaken by the Colonial Institute. [Or in the Lindley Library. ED.] It may be added that, at the gardens in Trinidad, as at others of these colonial gardens, periodical or occasional *Bulletins* are published of information most useful to tropical agriculturists; and these, too, should be made more accessible to those—perhaps not very numerous, but deeply interested—who might shape their future work on them. *Everard F. im Thurn, Torquay.*

* *Cacao*, by J. Hinchley Hart, F.L.S., Superintendent of the Royal Botanic Gardens of Trinidad. Printed at the Trinidad Government printing office, Port of Spain. 1892. Price 5*s*.

VARIORUM.

THE ORIGIN OF THE COLOURING MATTERS OF THE VINE.—The rapidity with which Grapes ripen in mid-Europe has recently led M. A. GAUTIER to suppose that the skin pigment to which the colour is due is formed by the oxidation of aldehydic or catecholic substances, which originate in the Vine leaves, and are carried by the sap to the ripening fruit. This view was borne out by the effects following the removal of the leaves from Grape Vines the fruit of which is on the verge of ripening, or by the partial or complete stoppage of the circulation between the leaves and stem; the Grapes in the first case remaining in a state of arrested development, whilst in the second case the leaves changed in colour to red or brown, and not the Grapes. M. GAUTIER extracted the colouring matter of leaves thus reddened (from Vines of the Cariguan stock), and examined it chemically. The result completely substantiated his original conclusion—the colouring matter was found to consist of three ampelochroïc acids, namely, alpha, beta, and gama ampelochroic acid.

ENGLISH GRAPES IN AMERICA.—Among the supplies now found in New York markets, says *Garden and Forest*, are Strawberries from California at 1·75 dol. a quart, Black Hamburgh Grapes from English hothouses at 2·50 dols. a lb., hothouse Tomatos from Boston at 1 dol. a lb., new Chicory from Louisiana at 20 cents a head, and fresh string Beans from Florida for as much as customers can be induced to pay.

WORSTED *versus* JUTE.—In our issue for December 10, 1892, we gave a short notice of the latest improvement in woollenised jute—to-day we have to notice that the production of a worsted-yarn which puts the other in the shade. The correspondent, who sends hanks of the worsted, says:—"The specimen is a copy of one used in Saxony and France, but it is of English manufacture. This is produced in a manner and at a price to completely knock out the jute-worsted." The shades produced up to date are sixty in number, and are very fine. As to price, that is 1*d*. per pound less than the jute, and this lowness of price is accomplished by means of improved machinery for "throwing." We await the next development in the jute product!

ENQUIRY.

"*He that questioneth much shall learn much.*"—BACON.

WILL some of our correspondents kindly inform "J. S.," which varieties of Chrysanthemums are best for the following purpose. He has a wall facing west, which seldom has the sun upon it;

his employer thinks that there is a dark variety, *not* Julia La gravère, but a larger variety, which will do well in this position, and be useful for cutting about Christmas time; of course, it needs to be a very hardy kind.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (−) the Mean for the week ending December 31.	Accumulated. Above 42°, for the Week.	Accumulated. Below 42°, for the Week.	Accumulated. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending December 31, is furnished from the Meteorological Office:—

"The *weather* during this period was very cold over Great Britain, with a good deal of fog at the inland stations, but with fine clear weather on the coast. In Ireland the conditions were generally rather milder, and some slight rain was experienced.

"The *temperature* was much below the mean, the deficit ranging from 4° or 5° in Ireland to as much as 9° or 10° over the greater part of England, and to 12° in the Midland Counties. The highest of the maxima were registered on somewhat irregular dates, and ranged from 33° in 'Ireland, S.' and the 'Channel Islands, to 39° in the 'Midland Counties.' The daily maxima at the inland stations were very low during the greater part of the week. The lowest of the minima were recorded during the middle part of the period, when the thermometer fell to 9° in the Midland Counties (at Loughborough), to 11° in Scotland East, and to between 12° and 14° in most other districts; in the Channel Islands the lowest reading was 25°.

"The *rainfall* was almost entirely absent from Great Britain, and very much less than the mean in Ireland.

"The *bright sunshine* was fairly abundant over the country as a whole, but deficient in Scotland, north and west, and in the neighbourhood of London. The percentage of the possible duration ranged from 61 in the Channel Islands to 35 in 'England, S W.,' 34 in 'England, N. and W.,' and 38 in 'England, S.,' to only 6 in 'Scotland, N.,' and 8 in 'Scotland, W.' In London (owing to fog), the percentage was as low as 2."

MARKETS.

COVENT GARDEN, January 5.

MARKET still quiet, with good supplies. Prices generally unaltered. *James Webber, Wholesale Apple Market.*

On account of the continuation of the frosty weather, farmers will not load; consequently, stock is very low, and prices are advancing. Best samples, 85*s.* to 100*s.*; ordinary kinds, 55*s.* to 60*s.* *J. B. Thomas.*

SEEDS.

LONDON: *Jan.* 4.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to day's market thinly attended, with but little business doing. American cables come strong. The United States Government have just issued their official estimate of this season's Clover-seed crop. which they put at 42 per cent. of an average yield. The total requirements of the United Kingdom are reckoned to be about 10,000 tons. These statistics, in view of the short European crops, indicate an advance in values. Alsyke, white, and Trefoil show this week no quotable alteration. Canary and Linseed are both very firm. The cold weather causes an improved inquiry for Peas and Haricots. In Rape seed, the tendency is upwards. Mustard continues scarce and dear. For white Runner Beans, unprecedentedly low figures prevail.

FRUITS AND VEGETABLES.

SPITALFIELDS: *Jan.* 3.—Quotations:—English Apples, 2*s.* 6*d.* to 6*s.* 6*d.* per bushel; American do., 10*s.* to 17*s.* per barrel; foreign Tomatos, 1*s.* to 1*s.* 6*d.* per box; Seakale, 1*s.* 3*d.* to 1*s.* 6*d.* per punnet; Curly Kale, 1*s.* 8*d.* to 2*s.*; Spinach, 2*s.* to 2*s.* 6*d.* per bushel; Brussels Sprouts, 1*s.* 9*d.* to 2*s.* 3*d.* per half-sieve; Turnip tops, 2*s.* to 3*s.* per sack; Greens, 2*s.* to 3*s.*; Turnips, 1*s.* 6*d.* to 2*s.* 6*d.*; Carrots, 2*s.* to 3*s.*; Parsley, 2*s.* per dozen bunches; Celery, 9*d.* to 1*s.*; Horseradish, 1*s.* 6*d.* to 1*s.* 9*d.* per bundle; frame Cucumbers, 3*s.* to 6*s.*; Endive, 9*d.* to 1*s.*; Leeks, 1*s.* 6*d.* to 2*s.* per dozen; Savoys, 4*s.* to 6*s.*; Cabbages, 4*s.* to 5*s.*; Cauliflowers, 8*s.* to 10*s.* per tally; English Onions, 6*s.* 6*d.* to 7*s.* 6*d.* per cwt.; Spanish do., 5*s.* 6*d.* to 8*s.* per case; Belgian and Dutch do., 4*s.* 6*d.* to 5*s.* 6*d.* per bag of 110 lb.; Carrots, 50*s.* to 60*s.* per ton.

BOROUGH, *Jan.* 3.—Quotations:—Cabbages, 2*s.* to 2*s.* 6*d.*; Savoys, 4*s.* to 5*s.* per tally; Cauliflowers, 1*s.* to 2*s.* per dozen; Spinach, 1*s.* 6*d.* to 2*s.* per bushel; Brussels Sprouts, 1*s.* 9*d.* per half-sieve; Carrots, 2*s.* 6*d.* to 3*s.*; Turnips, 1*s.* 6*d.*; Parsley, 1*s.* 6*d.* per dozen bunches; English Onions, 6*s.* to 6*s.* 6*d.*; Dutch, do., 4*s.* 6*d.* per cwt.; Horseradish, 1*s.* 6*d.* to 1*s.* 9*d.* per bundles; English Apples, 2*s.* 6*d.* to 10*s.* per bushel.

FARRINGDON: *Jan.* 5.—Quotations:—Turnips, 50*s.* to 60*s.* per ton; Parsnips, 65*s.* to 70*s.* do.; Carrots, 45*s.* to 50*s.* do.; English Onions, £6 to £8 per ton; Sprouts, 2*s.* to 2*s.* 6*d.* per half-sieve; American Apples,, greenings, 12*s.* 6*d.*, and Spies, 13*s.* per barrel; Tomatos, 4*s.* 6*d.* per case.

STRATFORD, *Jan.* 4—The supplies to this market have been excellent during the past week, and, with a large attendance of buyers, a brisk trade was done at the undermentioned quotations:—Cabbages, 2*s.* to 3*s.* per tally; Savoys, 2*s.* 6*d.* to 5*s.* do.; Greens, 1*s.* 6*d.* to 2*s.* per sieve; do., 2*s.* 6*d.* to 4*s.* per dozen bunches; Turnips, 2*s.* to 3*s.* do.; do., 40*s.* to 50*s.* per ton; Carrots, household, 40*s.* to 50*s.* do.; do., cattle-feeding, 24*s.* to 35*s.* do.; Parsnips, 65*s.* to 70*s.* do.; Mangolds, 16*s.* to 20*s.* do.; Swedes, 18*s.* to 22*s.* do.; Onions, English, 140*s.* to 160*s.* do.; do., Dutch, 5*s.* to 6*s.* per bag; Apples, English, 2*s.* to 6*s.* per bushel; do., American, 12*s.* to 20*s.* per barrel; Brussels Sprouts, 1*s.* 9*d.* to 2*s.* per half-sieve; do., 2*s.* 6*d.* to 3*s.* 3*d.* per sieve; Radish, 1*s.* 9*d.* to 2*s.* per bundle.

POTATOS.

SPITALFIELDS: *Jan.* 3.—Quotations:—Main Crop, 70*s.* to 95*s.*; Imperators, 60*s.* to 70*s.*; Regents, 50*s.* to 60*s.*; Magnums, 50*s.* to 70*s.* per ton.

BOROUGH: *Jan.* 3.—Quotations:—English Magnums, 50*s.* to 65*s.*; Hebrons, 60*s.* to 70*s.*; Snowdrops, 60*s.* to 75*s.* per ton.

STRATFORD: *Jan.* 4.—Quotations:—Magnums, 50*s.* to 65*s.*; Bruce do., 55*s.* to 70*s.*; Imperators, 55*s.* to 70*s.*; Scotch Magnums, 65*s.* to 90*s.*; Main Crop, 70*s.* to 95*s.*; Belgian Magnums, 50*s.* to 65*s.* per ton.

LONDON AVERAGES: *Jan.* 4.—Magnums, 50*s.* to 70*s.*; Hebrons, 60*s.* to 80*s.*; Snowdrops, 60*s.* to 80*s.*; Imperators, 60*s.* to 70*s.*; Regents, 50*s.* to 60*s.* per ton.

FARRINGDON, *Jan.* 5.—Quotations:—Main Crop, 90*s.* to 100*s.*; Sutton's Abundance, 80*s.* to 90*s.*; Bedford Magnums, 65*s.* to 70*s.*; Lincoln do., 65*s.* to 70*s.*; Hebrons, 60*s.* to 65*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 31, and for the corresponding period in 1891:—1892: Wheat, 25*s.* 8*d.*; Barley, 24*s.* 3*d.*; Oats, 16*s.* 3*d.* 1891: Wheat, 36*s.* 4*d.*; Barley, 29*s.* 3*d.*; Oats, 20*s.* 10*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 115*s.*; do., inferior, 50*s.* to 75*s.*: hay, best, 75*s.* to 112*s.*; do., inferior, 50*s.* to 65*s.*; and straw, 28*s.* to 44*s.* per load.

NOTICES TO CORRESPONDENTS.

TO OUR READERS.—*The Editor begs leave to solicit from the readers and contributors to the Gardeners' Chronicle:—*

Short Practical Notes on Cultural Matters;

Early Intelligence of Local News likely to be of general interest;

Notes and Memoranda useful to the trade;

Specimens of New or Interesting Plants, Fruits, &c.;

Drawings or Photographs of Gardens, Trees, Flowers &c., and which if suitable for reproduction will be utilised so far as possible.

ABIES NOBILIS, *Hurnard.* If the plant is a seedling, nothing more will be necessary in the way of pruning than the cutting-back of rival leaders a few inches, so that the best one, which should not be topped as a general rule, may get away. The upper branches may be cut-back, say 6 inches, in the case of a plant the size of yours, and still more in larger trees. Much pruning is not to be advised. It should be done just previous to recommencement of growth, or afterwards. Leaf-mould, and a small quantity of loam, make a good top-dressing for the tree. The rainfall is usually sufficient for its needs.

ARISTOLOCHIA: *H. P., New Orleans.* The flower sent is a small one of A. brasiliensis—certainly not A. gigas.

EUCHARIS MITE: *H. C.* Your specimen is attacked by a fungus which generally accompanies mite in the bulb. We suspect this is the case in the present instance.

GARDENIA, CUCUMBER, AND MELON DISEASE: *J. R. M.* The Gardenia roots are full of a minute worm, Heterodera radicicola, figured and described in the *Gardeners' Chronicle*, pp. 488 and 489, April 9, 1887. There is no cure. You must burn soil and plants, and make a new start.

GLASSHOUSE CONSTRUCTION: *J. T.* The best wood to use is Red or Memel Fir. If well painted, it will last for half a century, even in houses used for forcing. One of the best is galvanised rolled steel bars (Newton's Patent), with no putty to fix the glass, no drip, no loss of heat, bars wide apart, therefore very little metal to subtract heat from the interior in winter, or greatly attract it in summer.

LUMINOUS TREE: *Correspondent.* A near relative of the Humbugia transparens. There may be some foundation for the statement in the actual presence of a luminous fungus, and in the exercise of a vivid imagination.

NAMES OF FRUITS: *Knowle Green.* Apple, Beauty of Kent.—*J. J. D.* 3, Dumelow's Seedling; 4, Dutch Mignonne; 5, Wareham Russet; 6, King of the Pippins; 9, Gloria Mundi; 10, Tibbett's Pearmain; 11, London Pippin; 12, Bedfordshire Foundling. Others not known.

NAMES OF PLANTS: *H. G. T.* 1, Croton Johannis; 2, Dendrobium aggregatum; 3, Dracæna ferrea; 4, Mystacidium filicorne; 5, Tillandsia sp. (send in flower); 6, Chamærops Fortunei.—*H.E.* Brassavola cordata.—*J.* A very fine form of Oncidium varicosum.—*James Brown.* We do not undertake to name varieties of florists' flowers.

SUBTROPICAL BEDS: *A. J.* The site being an exposed one, the plants employed to fill the beds should be able to withstand wind without becoming ragged, or be so low in stature as not to be greatly in danger of being blown over. Dwarfer-growing Cannas, as C. iridiflora Ehemanni, C. i. Gladioliflora, C. Antoine Chantin, Paul Bert; and Aralia spinosa, A. Sieboldi, Arundo donax variegata, Bocconia cordata, Polygonum Sieboldi, P. cuspidatum, P. compactum, P. Sachalinense, with the dwarf forms—P. affine, P. amplexicaule, to grow near the edge of the bed; Zea and Sorghum might be used, also Teucrium, Ferula, Helleborus atro-purpureus, Abutilon Thompsonianum, Spiræa aruncus, Plumbago Larpentæ, Tritoma Uvaria, and other Tritomas. With the exception of the Cannas, Zeas, and Abutilon, the above-named are hardy perennials, which, if used with discrimination, will be as effective as most of the tender so-called subtropical plants, and once planted, they will require little more attention than that incurred by an annual manuring or top-dressing with rich soil. These plants, with the exception of Zea and Sorghum, may be bought in the spring from any good nursery at cheap prices. If it is decided to employ plants of annual duration, sow on a hotbed at the end of January, seeds of Canna in variety, Ricinus Gibsoni, Solanum laciniatum, S. pyracanthum, Wigandia caracasana, and the dwarfer Nicotianas. A month later Zea and Sorghum may be sown in a warm house, also Acacia lophantha, Grevillea robusta, Perilla nankinensis, Melianthus major, Centaurea candidissima, C. Clementei, Chilian Beet (in April), Amaranthus melancholicus, Artemisia Judaica, &c. Most of these should be sown in pots and pans well drained and half-filled with siftings of soil in little knobs of the size of horsebeans, and over this fine moderately-rich sandy loam. Water and sow thinly. Again afford a little water. Keep the pots dark till the seed germinates, pot off before the roots get the least entangled, and continue for a month to grow them in the same temperature and under the same conditions as the plants were raised. Keep close to the glass to prevent etiolation of growth, affording air more or less according to the weather.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

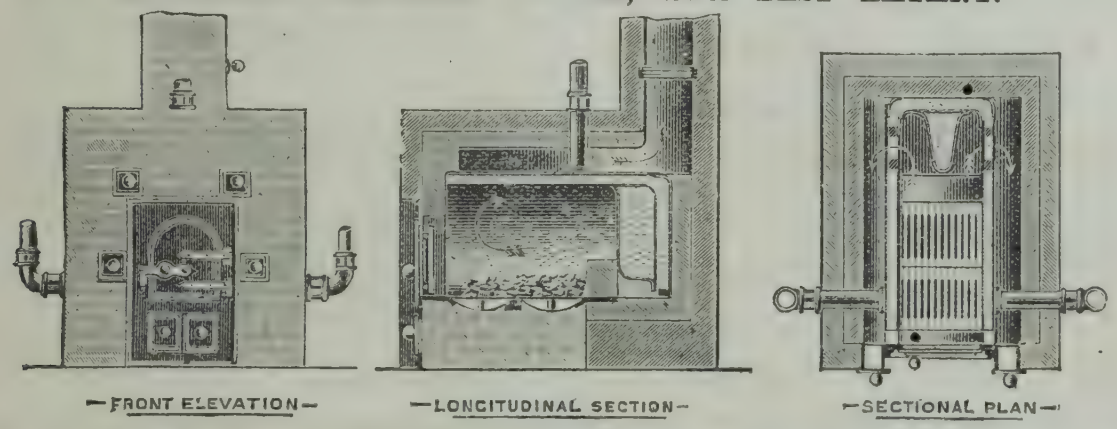
And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.



—FRONT ELEVATION— —LONGITUDINAL SECTION— —SECTIONAL PLAN—

The longitudinal section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in *brickwork, which is necessary for this class of boiler.* The cross section gives a view of the fire-box,

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds. *January* 9, 1886.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.

The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, *November* 10*th*, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESSRS. THOS. GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) G. W. BASHFORD.

And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for terms.
SPECIMEN FREE. Price 2d.

GARDENER (good SINGLE-HANDED).—Age 30, married, no family; thoroughly experienced in all branches. Can be well recommended. Wife as Laundry or Cook.—K. G., Maypole, Bexley.

GARDENER (SINGLE-HANDED, or with one under); young man, age 24. Good experience. Three years in present situation under Glass.—W. BUGBY, The Gardens, Ditcham Park, Petersfield, will be pleased to recommend above.

GARDENER; age 35; married.—WILLIAM BUGBY, for the last six and a-half years Gardener to L. T. Cave, Esq., is open to treat with any Lady or Gentleman requiring an experienced man.—WILLIAM BUGBY, The Gardens, Ditcham Park, Petersfield.

GARDENER (HEAD), or good SECOND.—Age 29; twelve years' practical experience in all branches. Good testimonial from last situation.—A. M., Mrs. Tackley, Albion Road, St. Albans, Herts.

GARDENER (SECOND, or SINGLE-HANDED).—Age 23; experienced in Flowers, Fruits, and Vegetables. Four years' good character from last place.—W. KEEN, Roe Green, Kingsbury, Middlesex.

MANAGER or FOREMAN.—Age 35, married; life experience in all branches. Thoroughly versed in the management of the business. Highly recommended by first class firms.—R. E., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOREMAN.—Age 28; fourteen years' experience in good private places, and can be well recommended.—T. WADE, South Street, Oakham, Rutland.

FOREMAN PROPAGATOR and GROWER.—Age 25; life experience in growing Plants and Cut Flowers, and Fruit for Market and Retail.—E. CLEMENTS, Florist, Church End, Finchley, N.

FOREMAN (Inside or General).—Age 27. First-class experience in all branches.—W. D., Northridge Lodge, Boxmoor, Herts.

FOREMAN, in a Gentleman's establishment, where two or three are kept.—Age 26; thirteen years' practical experience in all branches. Two years as Foreman previously. Excellent testimonials.—J. DODD, 4, Lancefield Street, Queen's Park, W.

FOREMAN, in a good Establishment.—Age 26; twelve years' experience. One year as Foreman in last situation.—A. W., Fenwick Villa, St. John's, Worcester.

FOREMAN.—Age 30; well up in the Culture of Vines, Peaches, Stove and Greenhouse Plants, Ferns, Early and Late Forcing. Fifteen years' experience. Abstainer. Excellent characters.—GILBERT, John Street, Llangollen.

TO NURSERYMEN.—Two young Men seek engagement, one (age 28) as FOREMAN GROWER, Tomatos, Plants, Cut Flowers, Wreaths, Crosses, &c. The other (age 24) as General PROPAGATOR. Both have excellent references, London and provincial.—A. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

PROPAGATOR (Soft-wooded) and FERN GROWER.—Age 25; Stove and General Market first-class Pot Stuff. Ten years experience; good references.—H. C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GROWER of Soft-wooded Plants in General or Market Nursery.—Age 25.—H. HENDERSON, Uphill, Weston-super-Mare.

JOURNEYMAN, Inside, or Inside and Out, in a good establishment.—Age 20; four years' experience. Would like to improve himself. Both preferred.—F. LARGE, Harrowby Road, St. Vincent's, Grantham.

JOURNEYMAN (FIRST), or FOREMAN, in a small place, where four or five are kept.—Age 27; eight years' experience under Glass. Good character.—G. OSBORNE, Turnpike Road, Hacheston, Wickham Market, Suffolk.

JOURNEYMAN.—Age 21. In the Plant Houses. Two years in present situation; three and a-half years previous.—W. PETTET, Belvoir Castle Gardens, Grantham.

IMPROVER, in a Nursery or good Private Garden.—Age 20; six years' experience. Seeks situation as above; good character.—W. D., 4, Havelock Place, Slough, Bucks.

KNIFEMAN (Outdoor).—Age 18; good Budder and Grafter, Training, &c. Four and a-half years' experience; good character. Reply, stating wages, &c.—GEORGE DAVIES, Nurseries, Downham, Norfolk.

HANDY-MAN (GLAZIER, PAINTER, and CAULKING) would be glad to hear of a Job.—Any district; own tools. Good references. Shortly disengaged.—G., 3, Sunnyside, Sidcup, Kent.

GARDEN BOY.—A Lady recommends a Garden Boy (age 18). Eight months' character. Leaving through breaking-up of establishment.—W. DEAN, Stoke Green, Wexham, Slough.

TO GARDENERS.—A young Man, age 24, seeks situation in the Fruit Houses. Two years in present situation.—H. TOWNSEND, Elvaston Castle Gardens, Derby.

TO SEEDSMEN.—Advertiser requires re-engagement. Ten years' experience, first-class London House and Provinces. Used to smart Counter Trade. Highest references; steady.—H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO THE TRADE.—I can recommend a reliable young man (age 22), with experience at the Counter or Office. Shall be pleased to give all particulars to any good Wholesale or Retail House.—THOMAS BUTCHER, Seed Merchant, Croydon.

TO NURSERYMEN and FLORISTS.—A young Man seeks a situation. Is of good address, and has a thorough knowledge of Floral Work and all branches of the Trade.—M. F., 3, Keaway Road, Earl's Court, S.W.

CONFIDENTIAL CLERK, BOOKKEEPER, and SALESMAN.—Botanical knowledge; fifteen years' experience, London and Provinces; expert writer; undeniable references. Married; abstainer.—W. W., 3, Clewer Terrace, Haven Green, Ealing.

SHOPMAN (ASSISTANT).—Age 20; three years' good experience in Seeds. First-class references. H. GREENWOOD, 48, St. Georges, Canterbury.

SHOPMAN.—Fourteen years' experience in the Nursery and Seed Trade. Good references.—J. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (ASSISTANT).—Ten years' experience in all branches. Abstainer. Good references.—J. H., Messrs. Stuart & Co., Seed Merchants, 19, Tavistock Street, Covent Garden, London, W.C.

SHOPMAN (ASSISTANT).—Age 26. Ten years' experience in Seeds, Bulbs, Plants. First-class references; used to brisk counter trade.—PLOWMAN, 45, Rosebery Street, Prince's Road, Liverpool.

SHOPMAN, or MANAGER.—Age 31; has a thorough knowledge of the Trade in all branches. Seeds, Plants, Bulbs, Sundries, General Furnishing, and Jobbing Work.—EUCHARIS, 41, Wellington Street, Strand, W.C.

SEED TRADE (ASSISTANT).—Age 21; over three years' experience in first-class Agricultural House. Willing to be useful.—X., 15, Woodville Road, Bowes Park, N.

TO FLORISTS and FRUITERERS.—Re-engagement desired by a young Lady. Thoroughly well trained in both branches. Unexceptionable references from previous engagements.—S. W. M., 35, Mardale Street, Shepherd's Bush, London.

TO FLORISTS.—A young Lady, thoroughly experienced, seeks re-engagement. First-class references.—E. W., 2, Vandevoid Villas, Northcote Road, St. Margarets, Twickenham.

HOLLOWAY'S OINTMENT and PILLS.—Chest and Stomach Complaints.—The source and centre of almost every ailment is impurity of the blood; dislodge this poison, and disease departs. Holloway's Pills exercise the inestimable power of thoroughly cleansing each component part of the blood, and rendering this fluid fit to perform its important functions. They cope most successfully with chest diseases, stomach complaints, liver disorders, and many other maladies, which were once the besetting dangers of mankind at certain seasons in town and country. The directions for use enable everyone to regulate the operation of these Pills with the greatest nicety. Chronic invalids, nervous sufferers, and all whom other treatment has failed to relieve, are respectfully invited to try Holloway's celebrated medicine, which will strengthen and cure them.

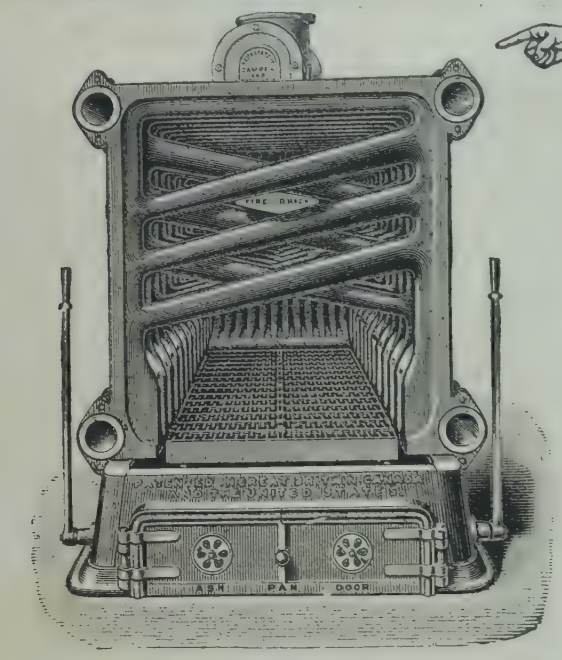
AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

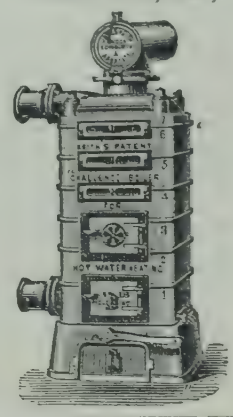
FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

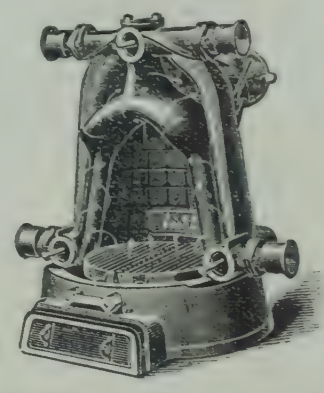
KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.



This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from HOOD, on *Warming by Hot-water*, New Edition, 1891.

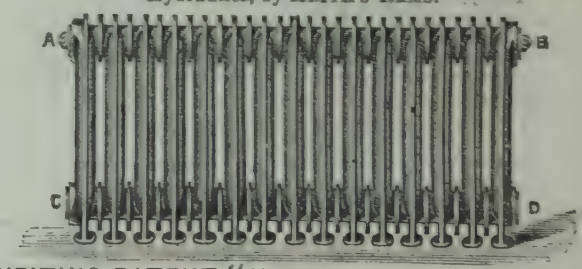
KEITH'S BOILERS
are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.





KEITH'S PATENT RAMS & HYDRAULIC RAM-PUMPS,
Self-acting, For Raising Water

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.



KEITH'S PATENT "UNIVERSAL" RADIATORS,
For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. *No Joints to Leak.* Thousands in use.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), **Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer.** Established 1823.
Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

WRIGHT AND HOLMES,

Horticultural Builders and Hot-water Engineers, BIRMINGHAM.

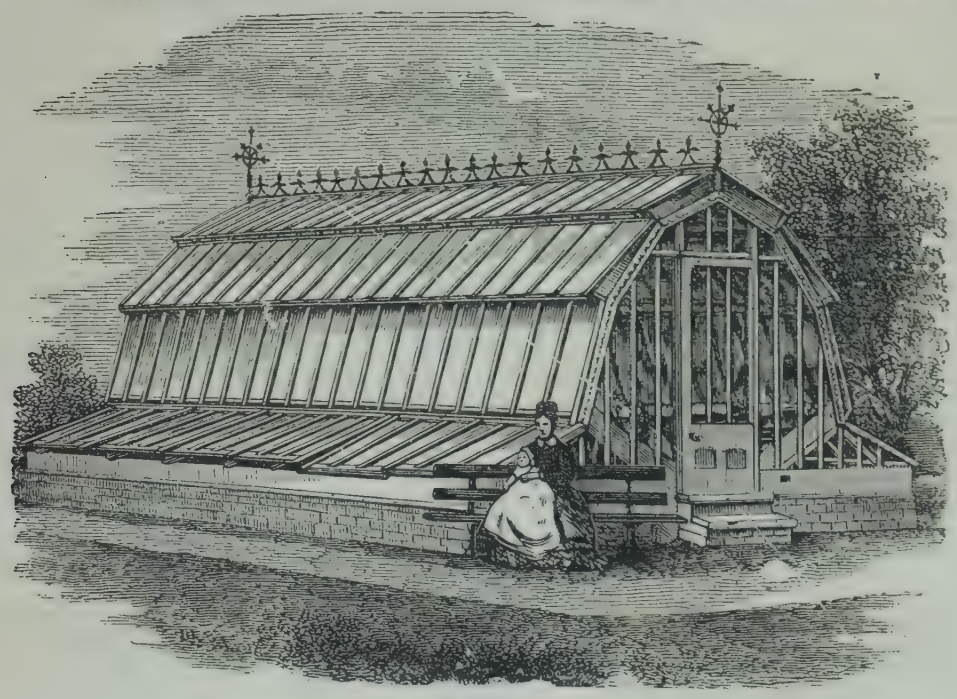


FIGURE 4.

THE GARDENER'S GREENHOUSE.

"THE GARDENER'S GREENHOUSE" has on each side of it a range of useful pits, which, with the Greenhouse, gives a building complete in itself of great usefulness. The system of construction makes it a Tenant's fixture, as no attachment need be made to the freehold. All can be removed at will, and refixed without loss or damage, the glass being fixed in the patent water-tight grooved bars with copper screws, without the use of putty.

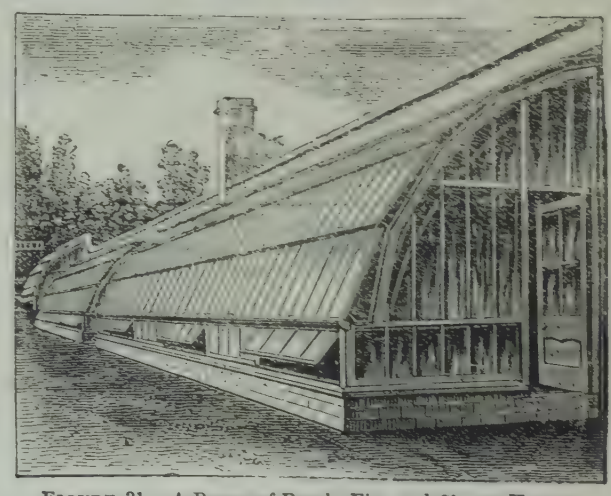

FIGURE 31.—A Range of Peach, Fig, and Cherry Houses.

FIGURE 7.—Wright and Holmes' Patent Portable Span-roof Frame. **(Every Man his own Glazier.)**

PLANS and ESTIMATES given for Greenhouses, Conservatories, Vineries, Peach Houses, Plant Houses, Orchid Houses, Pits, &c. **HEATING** by Hot Water with reliable boilers on the latest and most improved principles. **PRICE LIST** and full particulars sent post free on reference to this Advertisement.

WRIGHT and HOLMES, MOSELEY ROAD, BIRMINGHAM.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on THURSDAY NEXT, January 19, at 12 o'Clock, 200 dwarf ROSES, 90 lots of STOVE and GREENHOUSE FERNS, BEGONIAS, hardy BORDER PLANTS and BULBS, &c.

On view morning of Sale, and Catalogues had.

Friday, January 20, 1893.

MESSRS. PROTHEROE AND MORRIS have received instructions to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, January 20, at half past 12 o'Clock, a superb importation of the—

LANG-TANG VARIETY of DENDROBIUM NOBILE,

the short, thick-bulbed species, which are absolutely new to Europe, and are untried. They are most distinct in appearance, evidently free in growth, and we recommend them with the utmost confidence.

CATTLEYA LEOPOLDII,

the Pernambuco variety, described in the *Gardeners' Chronicle*, December 24, by Mr. Jas. O'Brien.

LÆLIA ELEGANS and LÆLIA GRANDIS,

of the old original form, and not to be confused with L. grandis tenebrosa, or the small variety of the species sometimes sold as L. grandis.

PHAIUS SANDERIANUS VAR.

Strong plants of this noble and stately form.

CATTLEYA ALEXANDRÆ, LINDEN.

A new Cattleya, discovered by M. Linden.

CHOICE HYBRID DENDROBES,

in Flower, and Showing for Flower.

ODONTOGLOSSUMS

in variety, in lots of 10, selected from well-established plants of the following:—O. nævium, purim, blandum, mirandum, Hallii, nevadense, triumphans, Edwardii, radiatum, cirrosum, facetum, &c.

CYPRIPEDIUM INSIGNE VAR. MONTANUM.

A wonderfully distinct fine-looking lot of plants, collected with great trouble and care. There is no doubt at all that self-yellow forms will be found in this importation, and we strongly recommend them to buyers.

The marvellous forms that have already appeared from our former importations, are a guarantee as to what may be confidently expected from this lot; and the plants being in really sound plump condition, should induce all admirers of this richly-endowed section to secure as many plants as possible when an opportunity like the present occurs.

VANDA CŒRULEA.

The Lang-tang Mountain variety—large flowers of the richest azure blue; a fine lot of plants.

DENDROCHILUM SPECIES,

From Dutch East New Guinea.

A very handsome new kind with yellow-green blossoms, which are redolent with a sweet perfume.

Also CYPRIPEDIUM INSIGNE VAR. and DENDROBES from the frontiers of Thibet, &c.

By Order of F. SANDER AND CO., St. Albans.

Also 40 lots of CATTLEYA MENDELII (another property).

On view morning of Sale, and Catalogues had.

WANTED, to PURCHASE or LEASE, a NURSERY, from 2 to 4 Acres, with modern Glass.—C. P. J., Brooklet, Hamworth Road, Hampton, Middlesex.

WANTED, to RENT or LEASE, GENTLEMAN'S GARDEN or NURSERY, with plenty of Glass. Near good Market Town.—M. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO BE SOLD, with Immediate Possession, a compact Nursery; nine Glasshouses in good working order. Lease, 21 years. Rent, £10 per annum. Pony, Van, Stabling, &c.—Grove Street Nursery, Upper Edmonton.

TO BE SOLD, an Old-established NURSERY, with some 50,000 feet of Glass, and 8 Acres of Land, well-stocked, and in going order; or a PARTNER would be entertained. Terms very reasonable. Apply to—T. HAWKINS, Horticultural Builder, Ashford, Middlesex.

FOR SALE, satisfactory reasons for disposal, a small compact NURSERY, mostly Glass. Substantial houses; low ground rent; over 90 years unexpired lease. Price, including Stock and Fixtures, £1500. £500 could remain at 5 per cent. Good business-growing district of Seaside Town.—Apply, M. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Nursery and Seed Business.

FOR SALE or PARTNERSHIP, well-established in one of the largest towns in the North of England. Nearly 4 acres of land, with large Stove and Greenhouses, Ferneries, &c., also Sale shop in one of the best positions in the town. Price for the whole, £1000, or half share, £500. Good trade, which can be greatly increased. Satisfactory reasons for disposal. Address, G. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FIRST-CLASS FREEHOLD HORTICULTURAL NURSERY for SALE, to LET, or PARTNERSHIP.—To a good practical man with £100 to £1000, this is a great chance. The present owner established it 25 years ago. It is within the borough of a large Midland town.—Apply to—S. HARVEY, Blyth Street Nursery, Woodborough Road, Nottingham.

TO LET.—A genuine SEED, FLORIST, and FRUIT BUSINESS, in a growing Market Town near London. Splendid opportunity. Main street. Small Nursery, with Glass. Good reasons for Letting.—ALPHA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Bournemouth—To Market Gardeners and Others.

TO LET, 2 to 4 Acres of LAND, suitable for Market Gardens, close to town. Also good Shop in main thoroughfare, if required.—Address A. H., 6, Cheltenham Villas, Bournemouth West.

TO BE LET, a small compact NURSERY, consisting of 5 Greenhouses, from 80 to 100 feet long, all well-heated with hot water, and with double and single Pits, being within 9 miles north of Covent Garden, at a low rental. J. W. WOODHALL, Oakleigh Road, Whetstone, N.

To Nurserymen, Fruit-Growers, or Florists.

TO BE LET.—The BULSTRODE LOWER GARDENS, situate near Gerrard's Cross, 5 miles from Slough, and 20 miles by excellent road to London, consisting of 12½ acres of good Garden Land, walled all round, and well-stocked with choice Fruit Trees; various Glass-houses, with good Furnaces, Vinery, Peach-house, Mushroom-house, &c. Extensive plantation of Nut Trees. Excellent Water-supply. Capital 9-roomed DWELLING-HOUSE. Useful Outbuildings. Also 4-roomed COTTAGE, &c. Maximum Rental (covering Rates, Tithe, &c.), £95 per annum.—Apply to W. C. HERON, Auctioneer and Estate Agent, Uxbridge, Middlesex.

Seed & Trial Grounds—Feltham & Twickenham, Middlesex.

VICTOR POTATOS

(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well-known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatos have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to

W. W. JOHNSON & SON,

Seed Growers and Merchants, Boston, Lincolnshire.

FIXED.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1*s.* 6*d.*; 8-in., 2*s.*; 10-in., 3*s.*; 12-in., 6*s.* 6*d.* 15-in., 8*s.*

(*The larger sizes are very strong for carriage drives.*)

SATURDAY, JANUARY 14, 1893

FONTHILL AND WARDOUR.

FOR some years past I had wished to visit Fonthill Abbey, that vast and eccentric building which wrecked the fortunes of Mr. Beckford, the author of *Vathek*. As I took Wardour Castle and Fonthill House *en route*, I will notice those places first, leaving Fonthill Folly—for there was much folly and not a trace of abbey in the building—for another occasion. It is about half an hour's journey by the train from Salisbury to the village of Hindon, and on leaving the station the woods of Wardour lie about three miles distant in one direction, and the Fonthills—for there are two adjacent places so named—will be reached within two miles, passing up the steep street of Hindon, and leaving the seat of Lord Arundel of Wardour in the rear.

We will visit the castle first. There is no need to ask the way, since the ruined old castle and its eighteenth century successor lie among these wooded hills that bound the view. Most of the chalk hills of this part of Wilts are devoted to unromantic Turnips and unprofitable corn, which leaves them bare and unlovely to the eye. One would know from the woods at Wardour that a great residence might be looked for among them, and that it must at least be as old as the timber. The original castle was, in fact, built by Lord Lovel in the last ten years of the fourteenth century, exactly 500 years ago. Owned by several noble families, it had dominated this part of the country about 250 years, when an exceedingly interesting accident occurred to it, and it was battered to pieces by Cromwell's soldiers. The defence of Lathom House by the Countess of Derby at the same tumultuous period was not more heroic than that of Wardour Castle by the Lady Arundel, wife of the second lord of that name.

It may be justly claimed on behalf of the brave cavaliers who defended at all costs, and in so many instances with utter ruin to themselves, their castles and manor houses, that they loved their honour better than their worldly prosperity, and their faith better than their lands. With a garrison of twenty-five men only, Lady Blanch Arundel withstood the efforts of the enemy during five days' bombardment, and capitulated at last, after having refused to surrender so long as the terms offered did not include quarter for the men, but only for herself, the women, and children. That active partizan of the Parliament, Edward Ludlow was then commissioned to garrison and hold the castle, which he did till its noble owner, Lord

Arundel, besieged it, and in the end sacrificed it to his loyalty by springing a mine, which laid it in ruins. It has never since been inhabited, and lies now a mass of ruins covered with Ivy, and venerated by all Englishmen who hold in honoured memory the high spirit and unbending sense of duty of men like Lord Arundel of Wardour.

The site of the ruins is beneath what is called an "amphitheatrical hill," crowned with the woods which one sees from the steep street of Hindon. The grand entrance to the castle remains, with the hexagonal court, which forming the centre of the ancient mansion, which, in its perfect state, was a fine example of a nobleman's residence at the beginning of the 15th century.

The deep well which Mr. Ludlow sunk to supply his garrison with water during the second siege is within this court. The smooth turf without the court is enriched with the more modern ornaments of exotic timber, including the Cedar of Lebanon, Cypress, and others that it is unnecessary to mention. Near this spot is a farm homestead, which includes the ruins of a mansion occupied by the family after the destruction of the castle. The present house, built rather more than 100 years ago, stands a mile distant, environed with woods like the older residence, and surrounded by a lawn. It is a noble edifice, built of freestone, and consisting of a centre and two wings, which project from the main front in a curvilinear form, having the porch in the centre, between the two projections. The nearest highway is the Salisbury and Shaftesbury road, from which the private road to the house passes through groves and private grounds, the little river Nadder taking its course through the park, and finding its level among the wooded hills through which it winds.

After this diversion in favour of one of the most [illegible] places in the historic county of Wilts, we may take a [illegible] look at Hindon, which, [illegible] also has its history, since it was formerly [illegible], like Old Sarum, a borough. Its venality has made it memorable. The story runs that a member returning thanks for his election, was bluntly told by an elector not to trouble himself, for if the squire, he said, had ordered them to return his great dog, "we should have chosen him all one as if it had been you, zur." Benjamin Disraeli unsuccessfully contested this borough, but as the squire did not send him, he was rejected. It will be noticed that the broad street is planted with trees, and towards the top of the street is a roadside inn, whose windows and little garden plots are bright with flowers in pots and beds, and so well kept, that one could not resist a call, when a smart and civil landlord came forward and gave this short and sufficient explanation—"Wife fond of flowers."

From here it is a pleasant walk to Fonthill. The estate owned by the eccentric builder of Fonthill Abbey has been divided, the original site having been sold to Mr. James Morrison, the millionaire. Fonthill House, to use its modern name, was destroyed by fire for the second time in 1755, when Alderman Beckford erected another mansion on the same spot, which was known as Fonthill Splendens, costing £240,000. It might have been splendid, but his son said it was damp, and he therefore sold it, and fell to work upon his famous Abbey on higher ground half a mile distant.

After the catastrophe, when the Abbey had tumbled down, the estate was divided as already stated, and what is now called Fonthill Abbey, which stands near the site of its unfortunate predecessor, was built by the Marquis of Westminster, and is now the residence of the gentleman to whom he sold it, Sir Michael S. Stewart, Bart. The present Fonthill House was built by the late Mr. Morrison, and has been enlarged by his son. It is a handsome modern house, bearing no resemblance to the Alderman's Mushroom edifice that preceded it. The beautiful park which surrounds it has the advantage of being much older than the house. The Beckfords had many predecessors, and the three houses of the past 150 years occupied the site of a noble residence of a very different style from any of them—the baronial seat of the Giffards. Fonthill Giffard, the picturesque village seated just outside the park, took its name from its original owners, and, truth to tell, the village church, erected by the munificent Beckford, has shared the misfortunes of his other buildings, having been replaced by the Marquis of Westminster, in his day, by one of French architecture in the style of the fourteenth century, with a tower and pinnacles.

At the time of my visit, Mr. Goodall, the gardener, was lamenting this year's very early autumn frost, occurring in the second week in September, and proving far more severe in the mild western counties than in London. Heliotrope, Tropæolum, Dahlias, and Scarlet Runners, and other things in the kitchen garden, were cut to the ground, the damage being greater than at the Abbey on higher ground. The Beech is the prevailing tree of the park, and there are some noble Oaks, Cedars of Lebanon, and exotics, on the lawn, and a lake in the valley before the windows, with higher ground sloping upwards beyond; and deer were seen among the glades of Beech woods in the distance. *H. E.*

NEW OR NOTEWORTHY PLANTS.

PAPAVER UMBROSUM, FLORE-PLENO.

THE *Revue Horticole*, in its number for January 1, gives a coloured figure of the double-flowered Papaver umbrosum raised by MM. Vilmorin, and which is, indeed, a plant of great beauty. It comes true from seed, which may be sown in the seed-plot in autumn, or in the border in spring.

STACHYS FLORIDANA.

The same number of the *Revue Horticole* makes mention of the tubers of Stachys floridana, which are utilised in the same way as those of S. affinis. It is said, however, that the flavour is "*sauvage*," which is certainly not a recommendation.

CYPRIPEDIUM VILLOSUM VAR. GORTONI *nov. var.*

A beautiful, distinct, and easily recognisable variety, sent to Dr. Gorton of 4, Maida Vale, London, W., by his nephew, from the extreme north of Burmah. It differs from the type chiefly in the different colour of its flowers. The upper sepal has a narrow purplish-crimson band extending up the middle to the bright emerald-green apex, and a clear white margin, the whole of the remaining surface being flaked, and tinged with light purple, and veined with darker purple, the colouring branching into the white margin in a very attractive way. The staminode is light yellow, or honey coloured, with an emerald-green boss in the centre; the lip is of a similar colour to the staminode, but tinged almost over its entire front-surface with pale rose. The petals are suffused with pale purplish-rose over the whole of their surface, except the narrow greenish-white margin. *James O'Brien.*

ASPLENIUM DUALE.

In our last issue, this plant was inadvertently mentioned under the heading of Adiantum, instead of Asplenium.

SELECT DECORATIVE FOLIAGE PLANTS.

(*Continued from vol. xii., p.* 731.)

PANDANUS VEITCHI.—This well-known table plant does not need any description here. In cultivation, the slender side-shoots taken from young plants have quite a different character from those taken from large and more vigorous-growing plants, as the former will make slender recurved leaves and form most elegant plants, while the latter produce leaves which grow nearly erect, and are much broader.

Pandanus javanicus variegata is also a handsome plant, but owing to the sharp saw-like edges to the leaves, it finds but little favour with the decorators. The Pandanads require stove treatment, and should be confined to small pots and poor soil. They will stand well as table plants, even in winter; but if kept out too long in a low temperature they die off, and though they may appear to be alive, will be found on examination of the stem to be dead. P. graminifolius is a pretty slender-growing species with green foliage.

Ananassa sativa variegata (Variegated Pine-apple) is a very effective plant for some purposes, but a little too dense for a table plant. It may be propagated from suckers or the tops of the fruits. Sometimes a fruit will give several tops; I have had as many as twelve from one fruit. Grown in sandy loam, they soon make useful plants, and if they are well exposed to the sun, they will have a reddish tint in the variegation. It is a good plan to suspend them to the roof in the warmest part of the stove.

Acalyphas are very pretty, and easily grown. They may be propagated from cuttings at any time of the year, and soon grow into useful-sized plants. To keep up a succession of useful plants, cuttings may be put in from time to time, taking the tops from such plants as have grown too tall to be serviceable; the plants may be potted in any ordinary compost, and grown in the stove, avoiding shade as much as possible. A. musaica and A. Macafeeana are the best species, the latter especially is very showy when well coloured. The best marked tops should be selected for propagating from. I have seen this plant when some of the leaves have been almost entirely of a bright crimson hue, or they may be irregularly blotched on a dark bronzy ground.

Myriocarpa stipitata is a fine foliage plant not often met with; it is perhaps owing to the fact that with age it becomes untidy in appearance. It may be propagated early in the spring from side-shoots taken from a plant which has previously had the top cut off. Small shoots with three or four leaves are best; these will soon root, if put in singly in small pots, using light sandy peat, and placed in the stove propagating pit. Loam and peat in equal parts, with a little manure and some sand added, will suit them well; the compost should be used as rough as possible, and not pressed firm. After the plants are well established, manure may be used freely. The large ovate leaves are of a pale greyish-green, with an irregular margin of a lighter colour, and form a fine contrast to most other subjects.

Cyperus alternifolius variegatus is a most elegant plant, and one which may, with care, be always had in good condition; it is one of the most effective table-plants, and may be largely used for almost any decorative work. It is readily increased by division. If this is done before the plants get pot-bound, they will suffer very little from being disturbed; indeed, it is rather an advantage than otherwise, for plants frequently divided make lighter growths, and are not so liable to revert to the green form. The plants may be potted in a light sandy compost, and require plenty of water at the root, but should not be wetted overhead much, or it will cause the white portion of the leaves to decay prematurely.

Cyperus laxus variegatus is a dwarfer-growing plant than the above, and when well-grown it is very pretty, and is likewise easily increased by divisions. For the green form of this species, see fig. 7, p. 41.

The normal green forms of the above Cyperuses are also useful plants; both sorts should be raised from seed.

Carex japonica is another useful "grass," more particularly as a small plant for vases, &c., and is much used by florists. If grown in 3-inch pots, it will attain to about 9 inches in height; but potted on into larger pots, and treated liberally, it will grow much taller. There is a variegated variety, which may also be recommended; this must be propagated by divisions. The plants should be potted in a loamy compost, and grown in the intermediate-house, or in summer-time they will do in cold pits.

Eulalia japonica variegata, though quite hardy, may be recommended as a pot-plant, and when grown in a little warmth, the long, slender, recurved leaves, regularly striped with white, are more effective than when grown out-of-doors. It is of easy culture, and most valuable for decoration. Plants rested during the autumn, and divided and started in heat early in the year, will soon make useful plants. The variety zebrina, which has yellowish bands running across the leaves, is pretty, but not so effective as the first-named.

Panicum variegatum.—This slender-growing variegated grass makes a fine edging for a group of foliage. It may be used for ordinary decorations during the summer, but in winter it is of no use except in the stove; it is easily propagated from cuttings, which root freely in the stove, propagating-pit, or any shady, moist position in the stove. If several cuttings are put into 3-inch pots, they can be potted on into 5-inch, without being divided. Any light sandy compost may be used for potting, but rich compost should be avoided, or the plants grow too freely, and lose the beautiful variegation. Used alternately with Isolepis gracilis, it makes a splendid edging for groups, especially on stages. Isolepis, though it will thrive well in the

Fig. 7.—Cyperus laxus. (see p. 40.)

stove, may also be grown in a cooler house, and is increased by division without difficulty. This useful grass succeeds best when grown in a light, open position.

A "VARIETY" SHOW AT READING.

A COLD, grey, gloomy sky, forming a dull background to the black leafless sprays of the trees, the hard ground, peppered with a thin coating of snow, the small streams frozen over, the larger ones as it were striving, and not very successfully, to keep an open channel, dull stagnation and sharp cold were thus the prevailing features in West Middlesex and the neighbouring counties: Reading itself was not more bright as we passed through it on the third day of this year. We mention these all too familiar circumstances because they serve to accentuate the contrast that met our eyes as we entered the span-roofed houses wherein Messrs. Sutton grow their Cinerarias, their Cyclamens, and their Primroses. "Come and see a blaze of bloom," was the text of an invitation we received; and, accepting it, we did see a blaze of bloom—purest of pure white flowers, whiter much than the sullied snow outside; pinks, reds, lilacs, purples, blues (nominal)—all shades of colour, as it seemed, with the exception of yellow. A visit to Messrs. Suttons' trial-grounds or houses, independently of the gratification furnished to the senses, always affords valuable lessons; the cultivation is remarkable for the evidence it affords of cleanliness, order, and skill; moreover, lessons of experience are here associated with the judgment derived from the practical study of physiology. The Darwinian teachings are here applied practically to systematic selection and cross-fertilisation in a most successful manner. Corelations of all kinds between cultural conditions, vigour, colour, form, arrangement of parts, and fertility, are all carefully noted, and, what is better, from our point of view, turned to practical account. And all this knowledge begets modesty. I was confident, says our guide, some years ago that I could, by following such and such a course, ensure such and such results. I did so repeatedly; but then came a change, I no longer succeeded. Some circumstance occurred, too trifling to be appreciated except in its results, and my confidence was shaken. When this happens, I make every effort to discover the reason, sometimes successfully, sometimes not.

We do not profess to give the exact words of our guide, but such was the gist of what he told us, enforcing his remarks by pointing to this or that specimen in illustration. In these days of technical education, the search for the reason why is a matter of the utmost importance. If we are to confine ourselves simply to the teaching of handicraft, we shall merely increase the numbers of average or inferior practitioners, of whom there are too many already, without improving the standard of cultivation or augmenting the number of capable men who are never too plentiful. A visit paid by County Councillors, lecturers, and those interested in education in cultural matters, to Messrs. Suttons' houses under the conduct of Mr. Martin, would afford valuable hints as to the best method of associating principles with practice, and of making the former conduce to the betterment of the latter. But we had come to see a blaze of bloom, not to be led away into a disquisition on education. It is relevant enough, however, as anyone will admit who has the opportunity we enjoyed. We suppose that we were so impressed with generalities of this sort, that we paid little attention to detail. In any case, we took no note of names, and must confine ourselves to a few salient points. Cinerarias were just about to flower, nice "stocky" plants of moderate height, with abundance of well-shaped flowers, just such as the gardener likes to see. Greenfly there was none, Lethorian cones—here much valued—secure immunity from this and other insect pests. But Messrs. Suttons' Cinerarias are not exempt from that curling in of the margin of the leaf that other less able and less experienced cultivators occasionally complain of—a highly consoling reflection to the amateur. It is hard to account for it; some plants are affected, whilst others are not, even when grown under the same conditions. Observation shows that plants with flowers of a particular shade of colour are more subject to it than others, and, further, that the peculiarity is more or less hereditary. In a plant thus predisposed by hereditary endowment, the slightest disturbance of the balance of growth, the slightest check, or the slightest stimulation from whatever cause, suffices to induce the cupping of the leaf.

The Cyclamens are further advanced than the Cinerarias, and present a mosaic of pure fresh colours most charming to witness. Here, again, the "habit" of the plant is everything that can be desired, and the variation in colour embarrassing. It would be more so, but that Messrs. Sutton follow the practice of growing side by side with their own varieties, others from all other available sources, so that the differences and resemblances, as the case may be, are at once appreciable. A free-flowering variety with flowers of moderate size and of clear salmon-pink colour was quite novel in tint.

The Chinese Primroses, from our special point of view, were the most interesting, as we made a comparative study of them a few years ago (see *Gardeners' Chronicle*, Jan. 26, 1889, p. 115), and, as, since that time, the aboriginal Chinese Primrose has been brought into cultivation. Prior to this time, all the Chinese Primroses in cultivation were derivatives, not directly from the wild plant, but from forms cultivated, perhaps, for long periods, in Chinese gardens. Naturally, it was felt that if we could get hold of the wild plant, up to that time unknown, coax it to grow and marry it to others, a varied and probably a brilliant future was in store for the Chinese Primrose. We need not repeat the history of the introduction of the "noble savage," for this has already been done in our columns, Jan. 26, 1889, and in the *Journal of the Royal Horticultural Society*. Moreover, we had the opportunity last year of figuring the plant in the first stage of civilisation, Jan. 2, 1892, p. 13, fig. 2, and from which it will be seen what a stride has already been made towards "improvement." This year, at Messrs. Suttons', the seedling plants show evidences of commencing variation in the foliage, and this we have no doubt will increase.

The plant in question has an interest independently of its history. It represents what naturalists call a species, a convenient term still, though not one that can be always satisfactorily defined. Its variations, therefore, have peculiar significance, because they do not depend on hybridisation—or intermixture of two species.

The same thing may, indeed, be said of the Cineraria and of the Persian Cyclamen, but these have been amenable to culture for a long time, and "crossings" innumerable, if not true hybridisation, have been effected. But in the aboriginal Chinese Primrose, only brought into cultivation a year or two ago, we have the opportunity of seeing matters, as it were, from the beginning. "Voir venir les choses, c'est le meilleur mode de les expliquer." Acting on this maxim, it is eminently desirable to keep a watch over this mountain Primrose, to trace its innate tendencies to vary, to note the results, if any, of its interbreeding with other kinds. We have used the particle "if," for, up to the present, Messrs. Sutton have been unable to induce the beautiful native to marry out of its tribe. So far it is fertile only with its own pollen, and a flower before us, as we write, has short stamens and an equally short style—an arrangement favourable to close fertilisation, and not the stamens and styles of different lengths—not the pin-eyed and thrum-eyed forms which in ordinary Primroses indicate an adaptation to cross-fertilisation by means of insects. This result, though not quite satisfactory to Messrs. Sutton, is noted with complacency by the writer of this note, who on first seeing the plant, then at Appley Towers, in the Isle of Wight, recognised it as the native species, dried specimens of which had, about that time, been sent over to Europe for the first time, and simultaneously, or nearly so, by Dr. Henry and by the French missionaries. The standoffishness referred to is an indication of the specific nature of the plant, but we have no doubt that it will not be long in Messrs. Suttons' possession before it will be tamed and coaxed to do pretty much what they desire. As for the other varieties, we have dealt with them on a former occasion; but as the processes of rational cultivation and reasoned-out selection and cross-breeding are constantly going on, it follows that there must be a progressive advance, and that improved quality, if not novelty, may be depended on. There is novelty, too, especially in shades of colour; but these must be seen, they cannot be described in words. One other point we must mention, and that is the Ivy-leaved race. A few years ago we came into possession of a single leaf, lobed, deep green, and glossy, like an Ivy leaf. We took it to be a variation or a monstrosity; but at Reading we were interested to see several representatives of a distinct race having these characteristics, the flowers of which are not yet quite regularised and fixed, so that in their present state they would not receive much attention at the hands of the florist; but the true florist knows how to wait, and seemingly he will not have to wait long for a very distinct race.

Sports in the Chinese Primrose are not so common as in the Chrysanthemum or Rose, for the reason that the Chinese Primrose being the offspring of a pure species, has not so much "mixed blood" in it. Nevertheless, they do occur, and one is now before us from the garden of E. Hyde, Esq. The plant has but a single crown. The leaves on one side of the plant are wholly green, and the green flower-stalk bears a truss of white flowers. The leaves on the other half of the plant have red stalks, and are red on the under surface, and the red flower-stalk bears a truss of rosy-lilac flowers. One leaf placed as it were midway between the green half and the red half of the flower, is partly green and partly purple on the under surface.

As we have no intention of writing a catalogue, we shall not pursue the subject further now; suffice it to say, that those who wish to revel in colour and form, and those who appreciate good cultivation, will find as much to attract their attention at Reading as will the naturalist, whose thoughts are of adaptation, variation, inheritance, cross-breeding, and the like items of latter-day philosophy.

A SYNOPSIS OF THE SPECIES OF CANNAS.

ALTHOUGH Cannas are such favourite plants in gardens, the genus is at the present time, from a botanical point of view, in a state of great confusion. In the Index, edited by Mr. Daydon Jackson, upwards of ninety specific names are kept up, but it is quite evident that a large majority of these represent mere garden forms. During the present winter I have gone through all the material which is available in London in the shape of books, drawings, and specimens relating to the genus, and cannot make out that there are more than about sixteen species in any broad sense. A large number of the forms which are now grown in gardens are evidently of hybrid origin, but their parentage has seldom been traced out and recorded. There are good sets at Kew, and in the Smithian herbarium at the Linnean Society, of the species described and figured by Roscoe, and of many of those named by Bouché there are type specimens from the Berlin garden at the Natural History Museum at South Kensington. After going through all these, I have drawn up the following synopsis of the original species and sub-species, and, as I have engaged to read a paper on the genus next summer before the Royal Horticultural Society, I shall be very glad to receive any further information, and to hear anything that your readers have to tell about the affiliation of the types now cultivated in gardens, and especially those enumerated and shortly described in Nicholson's *Dictionary of Gardening* to the specific types from which they have been derived.

In this genus the short outer wrapper of the flower, the three small green leaves that remain on

the top of the capsule, represents the calyx. The corolla is represented by the three longer equal leaves, of firmish texture, and greenish colour, that form the next row. The showy part of the flower consists of the stamens, which are brightly-coloured, and put on the appearance of ordinary petals. These petaloid staminodia are unequal in size, and to the margin of one of the inner ones the one-celled anther is attached. The genus is divided into four easily-recognisable sub-genera, by the length of the corolla-tube, and characters furnished by the staminodia; but of these sub-genera two contain only a single species each, and a third two species, leaving the great majority of the species in typical Canna, the types of which are all very closely allied, and difficult to limit and define, but which hybridise with one another readily.

Sub-genus 1. Eucanna; corolla-lobes and staminodia united in a short tube at the base, two or three of the upper staminodia being developed.

Group 1. *Three upper staminodia produced.*

1. C. indica (Linn., *ex parte*), Rosc. *Scit.*, t. 1; *Bot. Mag.*, t. 776. Stem slender, glabrous, green, 3 to 4 feet long. Leaves oblong, acute, green, the lower a foot long by nearly half as broad. Inflorescence a lax simple raceme; bracts suborbicular, green; some flowers in pairs. Sepals oblong, green, ¼ inch long. Petals lanceolate, pale green, 1¼ to 1½ inch long. Upper staminodia 3, oblanceolate, bright red, entire, 2 inches long, ¼ inch broad; lip linear, entire, red-yellow, spotted with red. Capsule globose, 1 inch diameter.

Hab.—West Indies and Guiana. This covers only a small part of the *indica* of Linnæus, Miller, and the older authors. Species 2, 3, 4, 12, 13, 14, as here treated, are not in any broad sense more than sub-species of *indica*.

Fig. 8.—Pyrus angustifol'a, flore-pleno: flowers fragrant, rose-coloured.

2. C. patens, Rosc., in *Trans. Linn. Soc.*, viii., 338; *Scit.*, t. 3; *Bot. Reg.*, t. 576. *C. indica* var. *patens*, Ait. *C. indica*, Curt. *Bot. Mag.*, t. 454. Stem slender, green, glabrous, 4 to 5 feet long. Leaves oblong, acute, green, the lower a foot long. Inflorescence a simple few-flowered lax raceme; bracts orbicular, green; flowers single or in pairs. Petals lanceolate, pale green, 1¼ to 1½ inch long. Upper staminodia three, oblanceolate, plain, bright red, entire, 2 inches long, ¼ inch broad; lip distinctly emarginate, bright red-yellow, with minute red spots. Capsule globose, 1 inch in diameter.

Var. C. limbata, *Bot. Reg.*, t. 771; Rosc. *Scit.*, t. 9. *C. patens*, Hook, *Exot. Flora*, t. 228. *C. aureo-vittata*, Lodd., *Bot. Cab.*, t. 449. Upper staminodia bright red, with a border of bright yellow.

Hab.—Tropical America. Here, apparently belong *C. spectabilis, saturate-rubra, variegata, recurvata, ventricosa, Sellowi, læta*, and *floribunda*, of Bouché. *C. occidentalis*, Rosc., in *Bot. Reg.*, t. 772, is a variety with only two upper staminodia produced, and from this *C. texensis*, Bouché, is not distinguishable by the description.

3. C. orientalis, Rosc. *Scit.*, t. 12. *C. indica* (Linn. *ex parte*), Roxb. *C. chinensis*, Willd., *Enum. Berol.*, 2, *ex parte*. Stem slender, glabrous, 3 to 4 feet long. Leaves oblong-lanceolate, the lower a foot or more long. Racemes lax, simple or forked; bracts oblong, the lower ¼ inch long. Sepals oblong-lanceolate, green, ⅓ to ½ inch long. Petals lanceolate, greenish, 1½ inch long. Upper staminodia three, oblanceolate, 2 to 2½ inch long, ¼ inch broad, bright red, often distinctly emarginate; lip red-yellow, distinctly emarginate. Capsule globose, one of the smallest in the genus.

Var. C. flavescens, Link., *Handb.*, i., 226. *C. orientalis flava*, Rosc., *Scit.*, t. 13. *C. indica flava*, Roxb. Upper staminodia and lip all yellow.

Hab.—Spread through the tropical regions of the Old World. We have no material for clearly separating *C. montana*, Blume, *C. pulchra*, Hassk., and *C. densifolia, exigua, Ehrenbergii, humilis*, and *pulchra*, of Bouché, all given as natives of the Old World. *J. G. Baker.*

(To be continued.)

NOVELTIES.

Pyrus angustifolia.—Mr. Oscar Tiefenthal, of Wandsbek, offers a new double-flowering Crab under this name. He tells us the tree is vigorous, bearing delicate pink, rose-like, fragrant flowers, contemporaneously with the leaves. The special features claimed for the new-comer are—perfect hardiness, great beauty of blossom and leaf, delicious fragrance, great adaptability to various soils.

The single-flowered form of the species was introduced to England so long ago as 1750, by Christopher Gray, nurseryman, of Fulham. It extends over large areas in the Atlantic States of North America. When in flower, says Sargent, it is not surpassed in beauty by any of the small trees of North America; and the traveller in the gloomy and monotonous Pine forests of the Southern States experiences no more delightful sensation than when he comes unexpectedly into some retired glade and finds it filled with these trees, covered by their delicious and fragrant flowers. A figure and full description are given in that beautiful and encyclopædic work of Professor Sargent, *The Silva of North America*, vol. iv. (1892), p 75.

FORESTRY.

THE OBSTACLES TO HOME TIMBER-GROWING.

Sir Arthur Grant, Bart., of Monymusk, Aberdeenshire, in noticing a review of the *Journal of the Royal Horticultural Society*, makes some interesting remarks on his experience in forestry. When old plantations were planted (he says), four pests of the forester did not exist in this (Aberdeenshire) part of Scotland—the rabbit, the squirrel, the Larch disease, and the lucifer match. Do what you like, it is very difficult to keep the rabbit entirely out of the plantation, and you must make up your mind to lose a proportion of newly-planted trees, and the trees are not out of danger for some years. When they are 25 feet high, or thereabouts, the squirrel attacks the Scotch Fir, eating the bark in spring on the sunny side. As a rule, he clears a patch perhaps 4 by 6 inches. From this the sap oozes out, and the winter wind snaps off the top, perhaps 4 or 5 feet from the tip; after this, your tree makes little progress. It is very difficult to see the squirrels in the Fir trees, and they are prolific little rascals. After killing perhaps 500 squirrels in a year, I find

the damage the following year to be little lessened, and I have thousands upon thousands of promising Scotch Firs destroyed or grievously injured by them at the present moment. Again, when your Larches have been planted perhaps twelve to fifteen years, the disease begins to show, and in many places, at about thirty to forty years of age, they go "pumped" in the centre, whilst yet too small to have much timber-value. Silver Firs also are now very subject to disease. Lastly, we have the lucifer match. Never a year goes by but we suffer at Monymusk more or less from the recklessly careless tourist or labourer, who lights his pipe, wanders on, and if he starts a fire, makes himself scarce at once. Last year a great deal of wood and young plantation and moor in Aberdeenshire was destroyed in this reckless fashion. In Switzerland they have very severe laws about firing the woods. These are some of the difficulties which surround modern plantations from which the older foresters were free.

In regard to profit, the labour of ditching, draining, fencing with walls, planting, and caretaking was much cheaper in the old days than at present. There was some sale for thinnings, which were largely used for rails. Now wire fencing and iron fences have stopped nearly the whole of that outlet, and thinnings will not pay for cutting and hauling. Twenty years ago Larch timber was selling at 1*s.* 6*d.* per foot. This year I have known of some sold for 4*d.*, and the best price would be between 6*d.* and 9*d.*, except possibly in some very exceptional position. The accessibility of a wood has, of course, an enormous influence on the price. Scotch Fir, again, was sold at Monymusk early in the century for 1*s.* 9*d.* per foot; 4*d.* would be about the price nowadays—of course I mean in large quantities. Put £100 into plantation nowadays, put £100 out to interest at 5 per cent., and for every £40 you get for your timber in sixty years, you will get £70 in the other investment, and you will not have the loss occasioned by rabbits, squirrels, Larch disease, and fire; you will not have fences to keep up, or to employ men to destroy the vermin, and oftentimes to turn out your neighbour's cattle, which are busily destroying your young trees. I plant some 300,000 to 500,000 of trees yearly, but I know it is a poor investment, and I do it first as a family tradition; second, to give shelter and improve the climate; third, because it employs a very considerable number of people, both in summer and winter.

The old timber found in old castles was probably "natural grown," of very great age when cut, and placed in suitable positions for keeping. I have, on the contrary, plenty of beams probably 120 years old which are full of dry-rot, and much infested with the wood-beetle. I find the more beautiful and rare Coniferæ to be all perfectly unsuited to the climate of Monymusk. Some may do for ornament—none, apparently, for business.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Pickering Lodge, Timperley.*

ODONTOGLOSSUMS.—Plants of O. Roezlii, O. Phalænopsis, and Miltonia vexillaria will now grow away freely at this season if potted during September, a point in the culture of these plants which should be attended to annually. The compost should consist of good Orchid peat and sphagnum, with a fair sprinkling of crocks mixed with these. At that time of the year our plants are cleaned of thrips, scale, or green-fly, or whatever may infest them, a solution of Fir-tree oil being used for the purpose. After being washed by passing the leaves through the hand in the mixture, they get a rinse in clean water, and are then laid on their side to dry, and when dry, they are potted. The house in which the plants are cultivated, that is, the glass, stages, and span, and the pots that the plants stand upon, are cleaned at that season, and in this way a riddance is made of a lot of pests, even of the troublesome slugs and shell-snails. The plants do not, as a rule, require further cleaning before potting time comes again. The excessive dipping of these three species of Orchids has killed more of them than many gardeners are aware of. If Miltonia (Odontoglossum) vexillaria has abundance of rain-water and fresh air, it will grow quite well; and the grower should not be afraid of using the syringe over them, which will keep thrip and green-fly in check. On the first fine day that we get after the present hard firing ends, our plants will be well syringed—in fact, on every mild day we do some amount of syringing. The following are some plants which do well along with Miltonia vexillaria, viz., Odontoglossnm blandum, O. nævium majus, O. cirrosum, O. Harryanum, O. pulchellum majus, O. maxillare, O. nebulosum, O. cristatum Sanderianum, Masdevallia tovarensis, Restrepia antennifera, Epidendrum vitellinum majus, Lælia Dayana, Sophronitis grandiflora, Cymbidium eburneum, and Ada aurantiaca. Odontoglossum Roezlii requires more heat than M. vexillaria—in fact, our plants are grown in a warm corner of the stove, where they do fairly well. I have kept them on the dry side for some weeks, and shall continue so to do for some time longer. The plants receive plenty of moisture from the wetted stages and pots, and an occasional overhead syringing on a fine morning in winter, and occasionally whilst growing, which helps to keep down thrip; but constant dipping I do not recommend, as it has killed hundreds of this species of Orchid. O. Phalænopsis is another species not often observed in robust health. It requires a temperature of 60° all the year round, and the Miltonia vexillaria-house during the summer months is the best place for it, about October removing it into the stove for the winter, where it makes up well and flowers freely. It is kept somewhat dry at the latter season. Red-spider and yellow thrips sometimes infest this plant very much, but these pests can be kept under by means of insecticides. The temperatures for the different houses for the next six weeks or two months may be:—Miltonia vexillaria, 55° to 60° at night, 65° by day; Cattleya-house, 55° at night, 60° to 65° by day; Odontoglossum crispum, 45° by night, 50° by day; Phalænopsis-house, 60° to 65° at night, 70° by day; and everywhere a little air afforded by the lower ventilators.

The severe weather we have been having for the last fortnight has been much against the well-being of Miltonias and Odontoglossums, especially M. vexillaria, which does not like much fire heat at any time. Rather than use an excessive amount of fire heat in the house containing these plants, I put mats over the plants on the side stages, which I find to answer very well, in fact, I use these mats in most of the cooler houses in severe weather, as by so doing the temperature of the houses in the morning feels more genial than when the heat has been kept up by the apparatus solely, and less damping down is required. With the use of much fire heat, insect pests increase, especially thrips, so injurious to the plants—therefore it has other advantages. During the frost admission of air has to be done with care, but in the event of mild weather we shall be able to open the bottom ventilators. Without this bottom ventilation no Odontoglossum does well, nor when rain water is not used in the watering of the plants. We have had manure-water recommended for these plants, but I prefer to have the water without the manure.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Buxted Park, Uckfield.*

GLOBE ARTICHOKES.—The frost of the past week has brought the growth of these, in the open ground, to a standstill; but where the roots have been protected, young growth will still be plentiful. If some of the best of these be taken off, with a heel attached, and potted into 6-inch pots, and after this placed in pits, and subjected to gentle heat till roots are formed, then gradually hardened off in a cold frame, they will become good plants by the beginning of April, when they may then be planted out in the open. Plants treated in this manner will give a supply of fine heads long before those left in the ground come into use.

GENERAL WORK.—With such weather as we have experienced during this last fortnight, outside operations have been almost brought to a standstill. But while the ground is hard, wheeling can be done with more ease and without injury to the soil; so that where manure is needed, this should be done without delay. Heaps of refuse may now also be turned over, so as to have them in readiness for use when required. The Pea and Bean sticks needed for the ensuing season may now be procured and pointed ready for use. The present is also a good time for emptying and cleaning tanks and cesspools, and placing the refuse on the ground to be sweetened by the frost before being dug in.

FORCING GROUND.—Continue to collect leaves for mixing with stable-manure for the making of hot-beds. The heaps should be mixed together and turned over several times before being used, so that the whole may be sufficiently and uniformly heated, without which the eggs of injurious insects, such as slugs, will be hatched, causing much future loss of young plants. It is a good plan to put a few Lettuce leaves into the frames after the hot-beds are formed and soiled, for the gentle warmth of the soil soon causes any animal life that may still be in it, to become active. They will seek shelter under the leaves, which should be examined for two or three mornings in succession, and if any are found, they should be at once destroyed.

POTATOS in pits, that have grown 9 inches or 1 foot through the soil, should be carefully earthed up, using light soil that has been previously warmed to the same temperature as that in which the Potatos are growing. Choose a warm day when the sun is shining, if possible, taking care not to expose the plants longer than is actually necessary, for after the recent cold weather they will be very tender. Make another planting to succeed those already planted three weeks, to avoid a break in the supply. In giving air, be careful not to cause cold draughts to come in contact with the foliage, as this might cause a check. See that the soil does not become dry, but at the same time avoid a too liberal supply of water.

RHUBARB.—Where precautions were not taken prior to the frost to have some crowns of Rhubarb covered, the soil will now be frozen too hard to lift them. If such be the case, and roots are urgently needed, cover the crowns with Seakale pots; then put some fresh hot stable-dung over these. This will soon thaw the soil, so that the roots may be taken up.

MUSHROOM-HOUSE.—The late severe weather necessitated the use of much fire-heat, which has not been altogether congenial to the growth of the Mushroom. The most fleshy of these are grown in an even temperature of from 50 to 55° F., or such a heat as may be usually found in a close warm cellar; therefore avoid using more artificial heat than is really necessary to keep up the desired temperature. As the Mushroom-house is often used for forcing such things as Rhubarb and Seakale, and for blanching Chicory and Endive, the doors have to be opened oftener than is desirable. When these are placed at the north or north-east side of the building, they are exposed to the winds blowing from that direction every time the door is opened. It is a much better plan to have the doors of these structures opening into a shed if it can be made practicable, so as to avoid the direct impact of these cold winds. Where beds are becoming exhausted, give a gentle watering with warm water, in which salt at the rate of one ounce to the gallon has been dissolved. Collect and prepare material for making fresh beds as they are needed. When ready, choose, if possible, a warm day for getting this into the Mushroom-house, so as not to lower the temperature more than can be helped.

EARLY PEAS.—Those sown in frames a month ago, should by this time be well up above the soil. Care will be required in ventilating, for the recent cold frosty weather necessitated the lights being kept closed, which has made the plants somewhat tender. If a change should take place soon, do not be in too great a hurry to give a quantity of air, for cold draughts are apt to bring on mildew after the plants have been kept close for so long a period. Take advantage of the first warm day to examine the frames, for if mice have crept in, these destructive little creatures will soon do much damage.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

BUSH FRUITS: DRESSING THE BRANCHES.—Where the recent spell of severe weather has prevented the work of pruning being completed, it should be again taken in hand, and brought to a close at the earliest possible time, and especially is this important with regard to Gooseberry, Red and White Currant trees, which, so soon as the pruning is finished, should be syringed with water and fresh slaked lime and soot, in the same proportions as those afforded in last week's Calendar for orchard trees, which will not only protect the buds from birds, but will keep the bushes clear of moss, and quite healthy. Since I adopted this kind of dressing for these bushes, the Gooseberry caterpillar has not troubled me. It is of importance that the lime be fresh, and used directly it is slaked, for the mixture being then warm, it soon dries on the branches. With the return to milder weather, the bullfinches will begin to devour the buds, and no work at present is more pressing than that of securing the buds from these mischievous birds. The mixture is more quickly

applied if the nozzle is removed from the syringe; or the trees may be dusted over with air-slaked lime, a method of distributing it more convenient for amateurs, and those growing only a few bushes. But the dressing of fresh lime, applied as directed, is more effectual, and seldom requires to be repeated when used at this part of the winter, whereas it will be found necessary to do so with air-slaked lime.

PRUNING BUSHES.—Skill being required by the pruner of fruit-bushes, the work should not be entrusted to any ordinary garden labourer. It is not uncommon to see Gooseberry bushes, which are nothing but a mass of root-suckers, for which no method of pruning is exactly suitable. A bush should stand on a clear stem of about 9 inches in height, and if the cutting was properly prepared—that is, all the buds removed below the branches or, rather, the point where these spring—suckers will not give trouble; but where such do grow, they should be persistently removed with the suckering-tool. In pruning Gooseberies, sufficient branches should be left to carry a full crop of fruit, this being of primary importance, and far enough apart to admit of easy gathering the fruits which grow on the inside. Gooseberries, according to their habit of growth, require different methods of pruning; and whilst Red Warrington and others of a pendulous habit of growth should not be hard spurred, but simply pruned back to young wood, these shoots being shortened to the desired length, and to a bud on the upper side; those having an erect habit, like Whitesmith, and which make much wood, are best pruned by close spurring them, not omitting to replace old branches with young as may seem desirable.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

GREENHOUSE PLANTS.—AFFORDING PLANTS WATER.—Careful attention must be paid at the present time to the watering of all hard-wooded plants in pots; and the training of Indian Azaleas, and other plants which require it, should be looked to during the prevalence of bad weather. Keep a sharp look-out for mildew on Ericas. Camellias in bloom and bud should receive a good supply of cold water and fresh air whenever prudent to afford it; and when the houses are connected one with the other, open the doors to the other houses if the ventilators cannot be opened. The best Camellias for early blooming are Lady Hume's Blush, the old double and the single-flowered white, and Donkelaarii, red and white-flowered, and they are best planted out in well-drained beds of good turfy loam and sea-sand. A useful plant at this season is Clianthus magnificus, with its pale green foliage and large clusters of scarlet flowers; and where space is available, it should be planted against wall or pillar in well-drained soil. Useful sweet flowers at this season are Daphne indica alba, Rogiera gratissima, Heliotropium corymbosum and H. Triomphe de Liége, which, planted out in borders or in pots, are most useful. Mandevilla suaveolens should now be pruned in; the sweet-scented old plant likes a wall or a pillar, and flowers best near the glass. Early Cinerarias now coming into flower should be watered with clear soot-water, and fumigated to keep them clear of green-fly. If they are troubled with mildew, there is no better remedy for it on these plants and Roses than the mixture recommended by Mr. E. Molyneux for syringing, in his book, *How to Grow Chrysanthemums*, viz., 2 lb. sulphur, 2 lb. quicklime, 10 quarts soft water; boil for twenty minutes. Syringe with two wineglasses of mixture to 4 galls. of clean soft water. Attend to Lilium auratum, L. Harrisii, and L. candidum that have been potted and plunged under ashes, for if left in too long they get deformed; and they should be taken out of the coal-ashes when about 3 inches high and placed in a cool-house for a time, before they are pushed on in heat for blooming. Herbaceous Calceolarias in small pots should have a shift into larger, well drained pots, and a good rich soil, consisting of loam, leaf-mould, dry cow-dung, and sand, keeping them on a wooden shelf or trellis near the glass, and as cool as possible short of actual frost.

THE INTERMEDIATE-HOUSE.—Bouvardias that have done flowering should be moved into a cool-house, and kept rather dry at the roots for about six weeks; they will flower well again if placed in a little heat. The plants have been very brilliant this autumn; and they flower better and last much longer in bloom in a temperature of about 50° by night and 60° by day. The best varieties are Bockii, elegans, Hogarth florepleno, President Garfield, President Cleveland, The Bride, and Mrs. R. Green. Cliveia miniata should now be placed in a warm-house. If the plants were well grown during the past summer in 6 or 8-inch pots, and in a good compost of loam, leaf-mould, and sand, with a liberal supply of manure, and allowed to get pot-bound, they will flower abundantly. The soil in which Poinsettias are growing should be gradually allowed to become dry, laying the pots on their sides till cuttings are taken. Urceolina pendula should be pushed on in a little heat; its bright yellow flowers are very pleasing. Also introduce some of the earliest of the Amaryllis. Where there are numerous glass-houses, the past week, with the thermometer several times at zero, was an anxious time. A stock of iron and rubber rings and bolts, such as are supplied by some hot-water engineers, should be kept ready. Should a break occur, with these appliances a repair can be made in a very short time.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

THE PLANTING AND RE-PLANTING OF TREES, ETC.—A general thaw having set in, in the south, contemplated alterations or improvements in the garden that were in progress prior to the frost, should be pushed on. The removal or transplantation of shrubs and trees may be done with equally favourable results as in the autumn, provided care be taken not to remove too much soil from the roots, and also in having at hand a good supply of rich soil in which to plant, such soil being added plentifully, to allow for subsidence. After planting, afford a thorough watering, and continue this at intervals (in the case of large trees) throughout the spring and summer. For smaller shrubs one thorough drenching will generally suffice. All newly-planted trees and shrubs of more than ordinary size should be secured from waving by the wind by means of wire stays attached to stakes firmly driven into the ground, the tree having first affixed to it a leathern collar, or band of strong sacking, so as to prevent the bark being damaged where the stays are secured. With care, and providing the necessary appliances are at hand, large specimens, from 30 to 50 feet high, may be removed with success, even more so than in the case of smaller trees, examples of which may be seen here at the present time in such fine specimens as Thuya gigantea, 50 feet high by 28 feet in diameter; Abies nobilis, Taxodium sempervirens, and similar species, 30 feet in height, all of which are growing, and looking none the worse for their removal three years ago. All shrubs that have not as yet been thinned should be taken in hand without delay, and if the weather permit lightly fork over the soil under them in order to bury decayed leaves and other matter. A certain amount of care should be exercised by those engaged in freshening the soil of old shrubberies where the surface has become full of roots. The best method consists of raking off the leaves and rubbish, and mulching with leaf-mould, burnt earth, or decayed garden rubbish. It is a mistake to take away the fallen leaves year by year, and never to replace them with other nutritive materials.

THE BULB GARDEN.—Bulbs that were not planted in the autumn should be got in so soon as the frost is quite out of the ground, otherwise the effects of late planting will manifest itself in weak blooms, and this remark is no less applicable to Hyacinths, Tulips, Crocus, &c., which are planted in beds. The planting of Ranunculus and Anemone corms may be deferred for a week or so. Lilies may be planted at any time within the next four weeks, provided they are placed at a sufficient depth to exclude injury by frost. It is also a capital plan to put them up into small pots, and place in a cold frame, in cocoa-nut fibre or coal ashes, taking the precaution of covering the frame at night, planting them out when the weather is suitable. During the recent sharp weather doubtless a goodly supply of small stakes have been made and tied up in bundles, preparatory to their use for the Hyacinths and various other bulbs, as they come into bloom, as nothing is more detrimental to the effect of a flower garden in the spring than to see the Hyacinth flower-spikes being blown about, and covered with dirt, utterly marring their otherwise charming effect. Plenty of work may still be found in wet and frosty weather, in over-hauling and re-sharpening and sizing plant stakes, and making labels and pegs.

FRUITS UNDER GLASS.

THE PINERY: SUCKERS.—There will be little doing in this department before the middle of February. Supposing that the suckers were potted deeply in their pots in September, October, and the early part of November, they should not yet have encouragement to grow, but be rested in a temperature ranging from 55° to 58° by night, with air given by day if the temperature rise to 65°, but not raising the day temperature so high as this when the weather is dull. The bottom-heat will be high enough at 75° for the present.

SUCCESSIONS.—Only very early potted suckers will stand in need of repotting at this date, and only those which have well filled their pots with roots. In fact, no Pine-plant should be shifted before its roots have filled the soil and begun to run round the sides of the pot; on the other hand, when repotting is required, it should be done without delay—therefore it will be seen that there can be no fixed dates for repotting given. The bottom-heat may still remain at 85°, with top-heat by day, when dull, of 10° lower; but when the sun shines, the house may, when 85° is reached, be afforded an amount of ventilation which will keep it at that height. Never shift a plant unless it have one week previously received sufficient water to thoroughly moisten the soil. Queen Pines standing in 32's or 8-inch pots should not be put into larger pots than 12-inch, if they are to fruit in eighteen months from the sucker stage; plants in 6-inch pots being accommodated in 11-inch ones. It is not the biggest pots that are productive of the finest fruits, careful feeding in small pots accomplishing as much or more. More will be said about shifting the majority of the successions at the proper time. Growth is or should be slow at this season, or much drawing of the leaves will take place, and as a means of counteracting this evil beyond the lower temperature recommended, there must be no more aërial moisture dispensed than is sufficient to maintain the plants in health.

FRUITERS.—These, if Queens, may be started at this time to supply summer fruits, and where the bottom-heat is derived from Oak and Beech leaves, or tan, the bed must be freshened up by the addition of fresh, warmed material, taking out, in the case of leaves, some of the more decayed portions, and of tan, sifting out in a half-inch meshed sieve a large portion of the finer particles. The new must be well incorporated with the old materials, and care should be taken not to add so much as will cause a great access of heat—85° to 90° will be sufficiently high. Where hotwater-pipes supply the bottom-heat, the matter is entirely under the gardener's control. Select the most likely plants for starting, those which have the thickest neck and the largest number of short pointed leaves. In getting these plants ready for plunging, strip off a few, three or four of the lowest leaves; afford a top-dressing of rich loamy soil, and take great care to press it well about the neck of the plant, but do not use a rammer about that part, or injury to the plant may ensue. Do not tie up the leaves, as these are easily injured. When plunged, which may not be at first to their full depth, water them with water 80° and guano, and maintain a day temperature to the end of the month of 70° without and 80° with sun-heat; and 65° at night except in very frosty weather, when 2° or 3° less will be less harmful than excessive fire-heat. The paths and walls should be sprinkled twice or thrice daily, but no water should be put in the troughs over the hot-water pipes.

VINES.—A vinery of Sweetwater and Hamburgh Grapes may be started about this date for supplying fruit in early June. Also Muscat of Alexandria and Black Alicante if these be wanted in a ripe condition in the middle of July. Supposing that the borders have been redressed with rich loam, bone-meal, &c., and if they are outside as well as inside, the former have been protected by means of dry litter and shutters, tarpaulin, or the like, the canes should be taken down and their ends allowed to hang on a level with the wall-plate of the vinery. A heap of sweetened stable-dung and leaves may then be put into the house and turned at intervals, and also receive additional materials if its heat should soon decline. Where the old-fashioned brick-pit remains in a vinery, the fermenting materials may be turned into it, and the bed utilised for propagating purposes. Syringe the canes twice, or oftener, daily, but see that they are dry by nightfall; and let the temperature at the commencement range from 40° to 45° by night, and from 6° to 10° higher by day, and increase by 1° weekly, night and day, till the flowering time, when it may be 65° for Sweetwater and Black Hamburgh varieties, and 70° for Alicante and Muscat of Alexandria at night, descending after flowering 5° in these two classes of Grapes.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JAN. 17 — Royal Horticultural Society's Committees, at the Drill Hall, James Street, Westminster. Horticultural Club. General Meeting of the Gardeners' Royal Benevolent Association, at Simpson's Hotel. Strand, W.C. National Rose Society.

SALES.

MONDAY, JAN. 16 — Plants and Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, JAN. 18 — Liliums, auratum and others, from Japan, Begonias, Tuberoses, &c., at Protheroe & Morris' Rooms.

THURSDAY, JAN. 19 — Roses, Ferns, and Plants at Protheroe & Morris' Rooms.

FRIDAY, JAN. 20 — Orchids from F. Sander & Co., St. Albans.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37°.

Railway Rates.

THE proposed increase in the charges for conveyance of goods by rail has not unnaturally caused great commotion among all classes of traders. It is the outcome of an attempt to introduce order and uniform procedure into what was previously a mass of chaotic inconsistency. A Commission, consisting of Lord BALFOUR OF BURLEIGH and Sir COURTENAY BOYLE, was authorised to revise the classification of goods carried by railways, to fix maximum charges, and to report to Parliament. A joint committee of both Houses was then appointed to discuss the matter, and to hear the evidence of the railway companies and of the traders. The action of the companies followed upon this committee. At present all that seems clear is that the companies have power to charge "maximum" prices, and producers and traders do not exactly know what these maximum prices may be. Some of these points may be cleared up at the meeting of the Mansion House Association to be held on the 30th inst. under the presidency of Sir JAMES WHITEHEAD.

Supposing the maximum tariff to be insisted on in all cases, the result, so far as we can see, is that some industries in which we are concerned must be well nigh annihilated, and that some ventures of great promise, such as fruit culture, and the culture of flowers for market, must be nipped in the bud. In some cases, water-carriage will be available, and the fruit-growers of Mid-Kent will doubtless avail themselves of the old-fashioned "hoy," such as their fathers depended on, obviating the delays and uncertainties of such a mode of conveyance by resorting to the employment of steam-tugs.

From a Kentish paper we take the following figures, which, even if not strictly accurate, sufficiently show the tendency against which the agriculturists and horticulturists of the country will have to fight.

The carriage of coal is raised, according to the figures before us, from 5*s.* 11*d.* per ton, to 8*s.* 3*d.*; cement, 6*s.* 8*d.* per ton, to 12*s.* 6*d.*; timber, 9*s.* 7*d.* per ton, to 12*s.* 6*d.*; bricks, 5*s.* 4*d.* per ton, to 8*s.* 9*d.*; manure, 5*s.* 11*d.* per ton, to 8*s.* 7*d.*

Supposing these figures to be a remote approximation only to the truth, it is obvious that they will cut in to the margin of profit so severely that nothing will be left. Perhaps the railway companies, perceiving this, will prove sufficiently shrewd to avoid the suicidal process of killing the golden goose.

We await further information, but in the meantime it is our duty to call the attention of our readers to the most serious danger affecting horticultural enterprise that has arisen in our recollection, and to urge upon them the necessity of united action. We suppose it is useless to expect the Royal Horticultural Society to move in such a matter, but possibly the Nursery and Seed Trade Association will resume its action on the subject. That body is much weaker, numerically and financially, than it should be. The imminence of the danger may, however, induce more of those concerned in commercial enterprises to join the Association and make its influence felt.

In the meantime we append a letter of Mr. GEORGE MONRO, of Covent Garden, published originally in the *Daily Telegraph*:—

There is one trade that suffers more than any other, and this when trade is exceptionally bad and prices scarcely sufficient to pay the grower.

I will give two instances of this:—We have a great many customers from seaside and provincial towns who attend our market, and have found it answered their purposed to buy home-grown as well as foreign fruits here, instead of depending only on local supplies. One firm has worked up a large trade, and had a rate on most goods of 11*s.* 8*d.* per ton. Now the carriage on the same goods is raised as follows:—

Onions	15*s.* 11*d.*
Oranges, Lemons, Nuts .	19*s.* 3*d.*
Apples	22*s.* 7*d.*
Tomatos	28*s.* 2*d.*

I wish particularly in this case to draw attention to the unfairness of raising the cost of carriage of home-grown produce represented by the two latter items as compared with the foreign. This is a gross injustice, especially since, as is often the case, these goods come the same distance to the market. The increase on Tomatos will be 33*s.* per ton, which means ruin to a growing business.

The other instance relates to Brighton, where the rate for most goods was 11*s.* 3*d.* per ton, and is now 20*s.* 10*d.* Under the new rate, a box of Oranges costs 2*s.* 6*d.*, while it used to be taken by carrier for 1*s.* before the railway existed. These facts are driving our growers to combine in starting lines of carriers by road, as they can get plenty of goods to load back with, grocers and other tradesmen being all willing to support them. Our trade has been a growing one, and profitable to the railways; but where we have to depend on them for transit, trade will be stopped, and in the end the railways will themselves suffer in consequence.

Covent Garden, January 10. GEO. MONRO.

The "Orchid Review."

A STRIKING illustration of the growing popularity of Orchids is evidenced by the appearance of this journal. France has her *Orchidophile*, Belgium her *Lindenia* and *Journal des Orchidées*, and in this country we have the serviceable *Orchid Album* and the sumptuous *Reichenbachia*, besides the admirable *Manual of Orchidaceous Plants*, published at intervals by Messrs. VEITCH.

Everyone of the publications mentioned is issued by a commercial firm. This fact does not detract from the value of the publications so far as they go, but it is obvious that commercial instincts, if not the commercial exigencies, must govern the selection of subjects and their treatment. The *Orchid Review* is independent of any commercial firm, and its scope, therefore, is not so likely to be restricted by prejudice and mere financial considerations. It is consequently addressed more particularly to amateurs.

In the new venture, descriptions of new species will form a feature, and special attention will be given to hybrids and hybridisation. The cultural department is in the capable hands of Mr. WHITE, who has charge of Sir TREVOR LAWRENCE'S collections at Burford Lodge. Mr. WEATHERS undertakes the description of the plants shown at the meetings of the Royal Horticultural Society. Hybrid Orchids occupy much space, not too much from a naturalist's point of view, but from the standpoint of decorative horticulture it would be well if nine-tenths of the hybrids raised were not suffered to appear on the exhibition table. No editor's name is given on the title page, but presumably the gentleman mentioned in the prospectus is responsible for the botanical details. Messrs. WEST, NEWMAN & Co., of 54, Hatton Garden, are the publishers, and the price is one shilling monthly. It is never fair to frame a criticism upon a first number. We must confine ourselves to welcoming the new-comer for its own sake, and for the evidence it affords of the progress of horticulture.

NEPENTHES MIXTA × (fig. 9).—Under this name we now publish a figure of a Nepenthes raised in Messrs. VEITCH'S establishment between N. Northiæ and N. Curtisi, and which in consequence received the provisional name of N. Northisii. This name was indicative of the mixed origin of the plant, but was objected to as implying the existence of a Mr. NORTHIS, a shadowy personage who has no real existence. It may then be better designated as N. mixta. The leaves are oblong acute subcordate at the apex and with a winged petiole. The pitchers are about 8 inches in length, with a fringed wing, cylindric oblong, of pale cream colour, flushed with green, and blotched with red, as in N. Northiæ. The fine ribs which surround the mouth of the pitcher are of a deep crimson colour. The lid is oblong, purple-spotted, without the curious process on the inner surface which characterises N. Curtisi, and the shallow wings are deeply laciniate.

THE LINNEAN SOCIETY.—An evening meeting will be held on Thursday, January 19, 1893, at 8 P.M., when the following papers will be read:—1. "The Plants of Malanji, collected by Mr. A. WHYTE, and described by Messrs. BRITTEN, BAKER, and RENDLE," by W. CARRUTHERS, F.R.S. 2. "A Report on the District Traversed by the Anglo-French Sierra Leone Boundary Commission," by G. F. SCOTT ELLIOT.

THE "NORTH" GALLERY, KEW.—A fifth edition of the official guide to this important collection has just been published. It is prefaced by a map and a biographical notice. The collection includes 848 coloured drawings. Notices are also given of the panels of ornamental woods below the paintings, amounting to no fewer than 246, whilst many are not determined. An excellent index concludes the pamphlet, which is to be had for 6*d.*

HORTICULTURAL SCHOLARSHIPS.—In addition to the scholarships offered by the Worshipful Company of Gardeners, and by the President of the Royal Horticultural Society, we learn that Baron Sir Henry Schroder has instituted a similar Scholarship of £26 annual value, for two years, the conditions for which we hope to announce shortly.

"BOTANICAL MAGAZINE."—The plants figured in the January number are:—

Nemesia strumosa, the beautiful herbaceous plant, introduced from the Cape by Messrs. SUTTON, and figured in our last volume, p. 269, f. 48, t. 7272.

Epidendrum spondiadum.—A Jamaican species, introduced to Kew by Mr. MORRIS. The racemes spring from the top of the pseudobulbs, and bear

FIG. 9.—NEPENTHES MIXTA (SEE P. 46)

four (or more ?) flowers, about 1 inch in diameter, greenish, blotched with deep red, stellate in form, with the outer segments lanceolate, the inner spatulate, the lip cordate-apiculate, with two calli, t. 7273.

Caralluma campanulata.—The very curious Cingalese Cactus-like Asclepiad, figured and described in our columns in our last volume, p. 369, f. 61. Kew, t. 7274.

Cypripedium fasciculatum.—A very curious Cypripedium, native of North West America (Washington Territory), with opposite leaves, and erect, many-flowered racemes. Each flower is subtended by a lanceolate bract. The fragrant flowers slightly exceed 1 inch in diameter, and the sepals and petals are lanceolate, rose-coloured outside, greenish-yellow within, with the veins red. The lip is straw-coloured, nearly globose, shorter than the segments, staminode three-lobed. Kew, t. 7275.

Iris Hookeriana.—A native of Cabul, Western Himalaya. It has a creeping root-stock, linear, strap-shaped leaves, and blue flowers. The sepals are spreading, lilac, mottled with darker spots, and having a yellow beard; petals erect, shorter, and paler, t. 7276.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of this Society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last, Mr. W. P. THOMSON in the chair. The Society is making good progress, fifty-three members having been elected during the past year. Three members are on the Sick Fund at the present time. One member who has been ill recently, was allowed 10*s.* from the Convalescent Fund. The amount of deposit standing to the credit of a nonpaying member was granted at the last meeting in accordance with Rule 14, the said member having ceased to pay since 1869, and having now reached 60 years of age. Messrs. DIXON, GUNNER, and PUZEY were elected auditors for the past year's accounts. The usual vote of thanks to the chairman ended the meeting.

GARDENERS' ORPHAN FUND.—We are highly pleased to be able to announce that H.R.H. the Princess of WALES has consented to become Patroness of this Institution, and has expressed her desire to use her influence with other influential persons on behalf of the Fund.

WOODFORD HORTICULTURAL SOCIETY.—At a meeting of the above Society held on the 9th inst., ANDREW JOHNSTON, Esq., chairman of the Essex County Council presiding, Mr. G. LAING PAUL of the Old Nurseries, Cheshunt, read an admirable paper on "Apples for Private Gardens," which gave rise to an interesting discussion. A hearty vote of thanks was accorded to Mr. PAUL for his paper.

NARCISSUS POETICUS PRÆCOX.—Mr. BAYLOR HARTLAND sends us a fragrant posy of this variety, which is specially valuable for its earliness. Mr. HARTLAND says he has been cutting a quantity for the last ten or twelve days. Under ordinary circumstances it flowers out-of-doors in March, being followed in succession by poeticus angustifolius and ornatus. All the flowers before us have the spathe bright green and leafy, instead of brown and membranous.

BLETTING IN BEAUTY OF KENT APPLE.—A specimen of this fine Apple has been sent to us, showing decay in an unusual form; the rind of the Apple is entirely black, thickened, and leathery, as if tanned, while the flesh is reduced to a brownish soft pulp, like that of a "bletted" Medlar. It is devoid of flavour, but of somewhat gummy consistence. We believe that Mr. HARVEY, of Canterbury, has made an analysis of the fruit, the results of which it would be interesting to record. It seems as if the malic acid had disappeared, and the starchy matter become converted into semi-gummy or pectic matter.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—The above has benefited greatly by large donations recently, and the Secretary of the Insti-

tution states that the QUEEN gave £105; Mr. B. STRETTON, Wisboro' Towers, Billingshurst, £1000; Mr. HENRY WHITE, Broad Oak, near Odiham, £100; and a legacy of £500 from the executors of the late Mrs. WILLIS, of Cheltenham.

DEVON AND EXETER GARDENERS' ASSOCIATION.—The first supper of the Devon and Exeter Gardeners' Association took place, we learn from the *Exeter Daily Gazette*, on Friday evening, January 6, at the Turk's Head Hotel. There were about fifty members present. The chair was occupied by Mr. HOPE (Messrs. VEITCH & SON), the vice-chairs being filled by Mr. T. C. BARTLETT (head gardener to Lady DUCKWORTH) and Mr. G. C. CRABBE (representing the amateur-gardener section of the Society). The affairs of the Association were stated to be in a most flourishing condition, and everything in connection with it in as satisfactory a state as could be wished.

SCOTTISH HORTICULTURAL ASSOCIATION.—Mr. A. M. MACALPINE, the consulting botanist to the Highland and Agricultural Society, delivered on the evening of January 4, in Dowell's Rooms, Edinburgh, the third of a series of lectures before the Scottish Horticultural Association on "The Structure and Physiology of Cultivated Plants." There was a large attendance of the association.

MULBERRIES.—In a *Bulletin* of the Cornell University Agricultural Station, Professor BAILEY discusses the cultivation of the Mulberry in the United States. Professor BAILEY admits the following types (omitting those grown as food for silkworms): —1, the white Mulberry, Morus alba, of which the Russian Mulberry, M. alba var. tartarica, and the nervosa Mulberry var. venosa, are forms; 2, the Multicaulis group = Morus latifolia; 3, the Japanese group = Morus japonica; 4, the black Mulberry group = Morus nigra; 5, the red or native Mulberry group = Morus rubra, of which the Lampasas Mulberry (var. tomentosa) is a variety. Under these groups six forms are mentioned, some of which are best for the northern, others for the southern States. The American varieties have been principally derived from M. alba and M. rubra, the European varieties from M. nigra, whilst the native American, M. rubra, has already furnished some varieties, and will probably produce others specially suitable to American conditions.

CONIFERS.—It is noteworthy that about the same time that the Conifer Report was issued, Prof. BAILLON should also have issued a part of his *Histoire des Plantes* containing a monograph of the genera of Conifers and allied orders. Professor BAILLON's treatment of the subject is very different from that adopted in the report, and mainly in the excessive "lumping" or consolidation that is practised, and which would render Professor BAILLON's arrangement inconvenient in practice. Sequoia disappears entirely, being sunk in Athrotaxis. Pinus, after PARLATORE's plan, is made to include all the genera of Abietinæ, but for practical purposes, at least, it seems best to keep the Silver Firs, Spruces, Larches, and Cedars distinct. At p. 19 the cone of the Spruce is given for that of the Silver Fir. Botanists will study Professor BAILLON's monograph with very great interest from the views he entertains respecting the structure of the flower in this order.

VEGETABLE AND FRUIT FARMING. — Mr. CHARLES WHITEHEAD has published a fourth edition of his *Hints* on this subject, which may be purchased in pamphlet form from Mr. JOHN MURRAY. We recommend its perusal to distressed farmers within easy distance of a market, and especially to allotment holders and amateurs. Mr. WHITEHEAD takes a reasonable view of the possibilities of profitable fruit culture, but we fear his pamphlet was issued before the late rise in railway rates. If this is persisted in, it will very seriously affect, or even annihilate fruit culture. In some districts carriage by hoy or canal boat may do something to restore the balance. Prof. EMORY SMITH, whom we have frequently mentioned in connection with the magnificent Leland Stafnord University and its department of horticulture, visited some four Kentish Cherry-orchards as the fruit was being picked, and shuddered at the careless way in which the fruit was handled without any selection. No doubt our fruit-growers have much to learn; and amongst other things they must learn to take pains. A separate section is devoted to "canning," in which also Prof. SMITH could give some useful counsel.

THE SURVEYORS' INSTITUTION.—At the ordinary general meeting held on Monday, December 19, 1892, the president (Mr. CHARLES J. SHOPPEE) in the chair, a paper was read by Mr. E. TIDMAN (Fellow) entitled "Sanitary Ventilation." A discussion followed and was concluded, and a vote of thanks was unanimously passed to Mr. TIDMAN for his paper. The second of four meetings of examinees and students authorised (subject to certain conditions) by the council to be held during the present session, will take place in the lecture hall of the institution on Monday, January 16, 1893, when a paper will be read by Mr. R. WATSON, entitled "A Devonshire Homestead." The chair will be taken at 7 o'clock.

THE DOUGLAS FIR. — Mr. GOODEN, of the gardens, Shopwyke House, Chichester (H. S. KENNARD, Esq.), sends us a photograph of a fine specimen of the Douglas Fir. It is about 55 feet in height, symmetrical, and well clothed with foliage from base to summit. When laden, as at present, with hundreds of light chestnut-coloured cones, it is a noble object.

AUTOMATIC DAMPER.—In our issue for July 9 last, p. 46, some remarks appeared respecting an automatic damper which had been patented. We have lately had an opportunity of seeing one of these that has been adjusted to a small boiler in the nursery of Mr. H. J. JONES, at Lewisham, where it appears to have answered perfectly. Mr. JONES told us that he had no trouble whatever with the regulation of the fire, and it maintains a more even temperature than any one of the others. Its principle and method of application was described in the article referred to above.

SAWBRIDGEWORTH.—On Wednesday, the 4th inst., the employés of Messrs. THOS. RIVERS & SONS were entertained at supper in one of the large houses, which was decorated for the occasion. About ninety-six men sat down to a substantial meal, the catering being in the hands of Mr. and Mrs. CAMP. Mr. T. F. RIVERS, in response to the toast of Messrs. RIVERS & SONS, said he was most happy to see all his men around him, and that it was owing to them and to their careful attention to their duties that the name of RIVERS was so well-known, not only in England, but in every quarter of the globe. He trusted that the friendship which existed would continue for years to come. After speeches by Mr. W. CAMP (foreman), Mr. J. DEDMAN, and Mr. J. BRACE, the rest of the evening was spent in amusement.

CHICAGO EXHIBITION.—The installation of exhibits has already begun, but has not yet progressed far. Soon, however, the interior of each one of the buildings will be the scene of great activity. The authorities are determined to have all exhibits in place at the opening of the Fair, and manifestly this cannot be accomplished if exhibitors are allowed to be dilatory. It will not do to permit the great mass of exhibitors to defer installing their exhibits until April, and accordingly state and foreign commissions and individual exhibitors will be required to be prompt. Exhibitors who are dilatory beyond a certain point will lose their space and be barred out. The requirements of the preparation of the official catalogue of exhibits also necessitate promptness on the part of exhibitors. This catalogue will be an elaborate publication, and, generally speaking, will have a separate volume devoted to each department. Its preparation is in charge of Major HANDY, chief of the department of Publicity and Promotion. It is the determination to have it on sale in complete condition on the opening day of the Fair, if it is possible to do so. That will, of course, depend mainly on the promptness of exhibitors. The section from one of the big Californian Redwood trees (Sequoia sempervirens), which the government will exhibit in its building at the World's Fair, has arrived at the Fair grounds. Eleven freight cars were required to convey it across the continent. It measures 30 feet long by 23 feet in diameter. The section is hollowed out, and when placed on end, divided into two storeys and lighted, as it will be, it will form a rustic house large enough for a family to live in.

PROFESSOR MUNSON, of the Maine State College, has issued a report of his experiments to determine whether any, and if so what, changes are effected by the influence of pollen on the ovary and the seed. He sums up as follows:—

"The evidence at hand indicates that within certain limits there is an immediate influence of pollen on the mother plant; but that these limits are quite restricted. The most important plants showing, unmistakably, immediate effects of foreign pollen are the Pea, the Kidney Bean, and the Indian Corn. It is possible that the Orange may be included in this list. Sweet Corn (Maize) shows the effect of foreign pollen more frequently than do the other races of corn. The theory of the double action of pollen—stimulating as well as fertilising — as suggested by NAUDIN and FOCKE, seems plausible; but in some species the ovary will develop in the entire absence of pollen. The most important examples of agamic development of fruit, are seen in the Egg-plant (Solanum melongena), and the English forcing Cucumber (Cucumis sativus). In no instance, when pollen is withheld, are perfect seeds developed. There appears to be no relation between the amount of pollen produced by a plant and the amount required for fecundation. There appears to be no relation between the amount of pollen produced by a plant and the number of seeds produced by its fruits. The amount of pollen applied may, in many cases, be of great practical importance in determining the form and size as well as the quantity of the fruit produced. The amount of fruit produced by certain varieties of Strawberries appears to vary, in some instances, with the amount of pollen supplied by the variety used as a fertiliser; but this occurrence is not universal. The form and size of Tomato fruits are directly dependent on the amount of pollen furnished — a small amount invariably resulting in small and deformed fruit. The English forcing Cucumber is usually deformed by the production of seeds, and the consequent enlargement of the apex, as a result of pollination; the amount of pollen used appears to be of no importance in determining the extent of the deformity. Pollen appears in many cases to act directly on the ovary, stimulating growth of that organ independently of any effect on the ovules—an effect most clearly seen in those species which do not readily cross. Indications point to the possibility of distinct effects from two male parents when pollen is applied to the same stigma at different times."

CARDIFF AND DISTRICT GARDENERS' ASSOCIATION.—The usual weekly meeting was held on Tuesday, January 10. Mr. A. PETTIGREW, gardener at Cardiff Castle, read a paper entitled "The Best Mode of Cropping Town Allotment Gardens." The paper was prepared and read by the request of the Association in consideration of the great number of allotment-holders in and around Cardiff. There was a good attendance of members, but, so far as the subject of the paper was concerned, the result was disappointing, for very few allotment-holders were present. Mr. PETTIGREW acknowledged the success

that was generally achieved in the allotments around Cardiff and gave useful information as to the best methods of improving the soil where poor, and also in regard to the vegetables most adapted for the purpose of allotment-holders. The culture of most of such was detailed, and a hint given that the best possible results could only be obtained by continual cropping.

ROYAL HORTICULTURAL SOCIETY.—The first meeting of the Society in 1893 will be held in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, January 17, when the Fruit, Floral, and Orchid Committees, will assemble at 12 o'clock, noon.

The following are the arrangements for the present year:—Popular afternoon meetings and lectures, in the Drill Hall, James Street, Victoria Street, S.W.:—

Jan. 17.—Show in the Drill Hall, James Street, S.W. Meeting at 3 P.M., for election of Fellows.
Feb. 14.—Annual General Meeting at 117, Victoria Street, S.W.
March 14.—"Some Effects of growing Plants under Glass of Various Colours," The Rev. Prof. Henslow, M.A.
" 28.—"Flowers of the Riviera," Mons. Henry de Vilmorin.
April 11.—"Orchid Life in Guiana," Mr. Everard F. im Thurn.

Dec. 12.—Show in the Drill Hall, James Street, S.W. Meeting at 3 P.M., for election of Fellows.

SCIENTIFIC COMMITTEE.

(*Established May* 5, 1868.)

Chairman.—Sir Joseph Dalton Hooker, K.C.S.I., M.D., C.B., F.R.S., The Camp, Sunningdale.

Vice-Chairmen.—Dyer, W. T. Thiselton, C.M.G., F.R.S., Royal Gardens, Kew; Foster, Professor M., Sec.R.S., Great Shelford, Cambridge; Masters, Maxwell T., M.D., F.R.S., Mount Avenue, Ealing, W.

Hon. Secretary.—Rev. Prof. G. Henslow, M.A., F.L.S., F.G.S., Drayton House, Ealing, W.

Baker, J. G., F.R.S., Royal Gardens, Kew.
Balfour, Prof. I. B., F.R.S., Botanic Gardens, Edinburgh.
Blandford, W. H. F., M.A., F.E.S., 48, Wimpole Street, W.
Bonavia, Dr. E., 5, Harrington Mansions, South Kensington.
Burbidge, F. W., F.L.S., Trinity College Gardens, Dublin.
Church, Professor A. H., F.R.S., Shelsley Gardens, Kew.
Clarke, Colonel R. Trevor, Welton Place, Daventry.
Darwin, Francis, F.R.S., Wychfield, Huntingdon Road, Cambridge.
Dod, Rev. C. Wolley, Edge Hall, Malpas, Cheshire.
Elwes, H. J., F.L.S., F.Z.S., Colesborne, Andoversford, Gloucestershire.
Engleheart, Rev. G. H., Appleshaw, Andover.
Farmer, Prof. J. Bretland, M.A., Royal College of Science, South Kensington, S.W.
Frankland, E., F.R.S., The Yews, Reigate Hill, Reigate.
Gilbert, J. H., Ph.D., F.R.S., Harpenden, Herts.
Godman, F. DuCane, F.R.S., 10, Chandos Street, Cavendish Square, W.
Green, Professor J. R., M.A., 17, Bloomsbury Square, W.C.
Lindsay, R., Botanic Gardens, Edinburgh.
Llewelyn, Sir J. T. D., Bart., F.L.S., Penllergare, Swansea.
Lynch, R. Irwin, A.L.S., Botanic Gardens, Cambridge.
McLachlan, R., F.R.S., Westview, Clarendon Road, Lewisham, S.E.
Michael, Albert. D., F.L.S., Cadogan Mansions, Sloane Square, S.W.
Morris, D., M.A., F.L.S., 11, Kew Gardens Road, Kew.
Müller, Hugo, Ph.D., F.R.S., 13, Park Square East, Regent's Park, N.W.
Oliver, F. W., D.Sc., F.L.S., 10, Kew Gardens Road, Kew.
Pascoe, F. P., F.L.S., 1, Burlington Road, Westbourne Park, W.
Plowright, C. B., M.D., F.L.S., 7, King Street, King's Lynn.
Russell, Dr. W. J., F.R.S., 34, Upper Hamilton Terrace, N.W.
Salvin, Osbert, F.R.S., Hawksfold, Fernhurst, Haslemere.
Scott, D. H., M.A., Ph.D., F.L.S., The Old Palace, Richmond, S.W.
Stewart, Prof. C., Royal College of Surgeons, Lincoln's Inn Fields, W.C.
Symons, G. J., F.R.S., 62, Camden Square, N.W.
Veitch, H. J., F.L.S., Royal Exotic Nursery, King's Road, Chelsea, S.W.
Ward, Professor Marshall, F.R.S., The Laurels, Englefield Green, Staines.
Wilson, Geo. F., F.R.S., Heatherbank, Weybridge Heath.

FRUIT AND VEGETABLE COMMITTEE.

(Established May 7, 1858.)

Chairman.—Crowley, Philip, F.L.S., Waddon House, by Croydon.

Vice-Chairmen.—Bunyard, George, The Nurseries, Maidstone; Lee, John, 78, Warwick Gardens, Kensington; Rivers, T. Francis, Sawbridgeworth.

Secretary.—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.

Balderson, H., Corner Hall, Hemel Hampstead.
Bates, W., Poulett Lodge Gardens, Twickenham.
Bennett, W., Rangemore Park Gardens, Burton-on-Trent.
Burrell, E., Claremont Gardens, Esher.
Cheal, Joseph, Crawley, Sussex.
Coleman, W., Eastnor Castle Gardens, Ledbury.
Cummins, G. W., The Grange Gardens, Wallington.
Dean, A., 62, Richmond Rd., Kingston-on-Thames.
Divers, W. H., Ketton Hall Gardens, Stamford.
Dunn, Malcolm, The Palace Gardens, Dalkeith, N.B.
Goldsmith, Geo., Leonardslee Gardens, Horsham.
Hogg, Dr., LL.D., F.L.S., 99, St. George's Road, Pimlico.
Hudson, J., Gunnersbury House, Acton.
Iggulden, W., Marston Gardens, Frome.
Laing, J., Junr., Forest Hill, S.E.
Lane, Fred. Q., Berkamsted.
McIndoe, James, Hutton Hall Gardens, Guisborough.
Miles, G. T., Wycomb Abbey, High Wycomb.
Norman, G., Hatfield House Gardens, Hatfield.
Pearson, A. H., The Nurseries, Chilwell, Notts.
Reynolds, G., The Gardens, Gunnersbury Park, Acton.
Ross, Charles, The Gardens, Welford Park, Newbury.
Sage, G. H., Ham House Gardens, Richmond, S.W.
Saltmarsh, T. J., The Nurseries, Chelmsford.
Smith, James, The Gardens, Mentmore, Leighton Buzzard.
Sutton, A. W., F.L.S., Reading.
Taber, G., Rivenhall, Witham, Essex.
Veitch, A., King's Road, Chelsea.
Veitch, P. C. M., The Royal Nurseries, Exeter.
Warren, W., Worton Gardens, Isleworth.
Weir, Harrison, Sevenoaks.
Willard, Jesse, Holly Lodge Gardens, Highgate, N.
Wright, John, 171, Fleet Street.
Wright, S. T., Glewston Court Gardens, Hereford.
Wythes, G., Syon House Gardens, Brentford.
Young, A., Abberley Hall Gardens, Stourport.

FLORAL COMMITTEE.

(Established June 24, 1859.)

Chairman. — Marshall, William, Auchinraith, Bexley.

Vice-Chairmen.—D'Ombrain, Rev. H. H., Westwell Vicarage, Ashford, Kent; Fraser, John, Lea Bridge Road, Leytonstone, E.; Paul, George, The Old Nurseries, Cheshunt.

Secretary.—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.

Bain, W., The Gardens, Burford Lodge, Dorking.
Baines, Thomas, Fern Cottage, Palmer's Green, N.
Barr, P., 12, King Street, Covent Garden, W.C.
Bause, F., Portland Road, South Norwood, S.E.
Cannell, H., Swanley, Kent.
Cant, F., Braiswick, Colchester.
Dean, R., Ranelagh Road, Ealing, W.
Druery, C. T., F.L.S., 25, Windsor Road, Forest Gate.
Fitt, J. H., The Frythe Gardens, Welwyn.
Furze, W., Roselands, Broom Road, Teddington.
Girdlestone, T. W., Sunningdale, Berks.
Godfrey, Thos., Hillingdon, Uxbridge.
Gordon, G., 1, Style Villas, Gunnersbury.
Herbst, H., Kew Road, Richmond, Surrey.
Ingram, W., Belvoir Castle Gardens, Grantham.
Jeffries, C., Boston House Gardens, Brentford.
Jennings, J., Ascott Gardens, Leighton Buzzard.
Laing, J., Forest Hill, S.E.
Leach, W. C., Albury Park Gardens, Guildford.
Lowe, R. B., Ashridge Gardens, Berkhamsted.
Mawley, E., Rosebank, Berkhamsted.
May, H. B., Dyson's Lane, Upper Edmonton.
Molyneux, E., Swanmore Park Gardens, Bishop's Waltham.
Nicholson, G., Royal Gardens, Kew.
Noble, C., Sunningdale Nursery, Bagshot.
Owen, R., Castle Hill, Maidenhead.
Pawle, J. D., 12, Stanley Gardens, Willesden Green, N.W.
Pearson, C. E., Chilwell, Nottingham.
Phippen, G., Victoria Nursery, Reading.
Ross, F., Bletchingley.
Salter, C. J., Woodhatch Gardens, Reigate.
Shea, Chas. E., The Elms, Foots Cray, Kent.
Stevens, Geo., St. John's Nursery, Putney.
Turner, H., Royal Nurseries, Slough.
Walker, J., Ham Common, Surrey.
Watson, W., Royal Gardens, Kew.
Williams, W. H. (Keynes & Co.), Salisbury.

ORCHID COMMITTEE.

(Established March 26, 1889.)

Chairman,—Veitch, H. J., F.L.S., Royal Exotic Nursery, Chelsea, S.W.

Vice-Chairmen.—Lawrence, Sir Trevor, Bart., M.P., 57, Princes Gate, S.W.; Masters, Maxwell T., M.D., F.R.S., Mount Avenue, Ealing, W.; Schroder, Baron, Sir Henry, The Dell, Staines.

Secretary.—O'Brien, James, West Street, Harrow-on-the-Hill.

Ballantine, H., The Dell Gardens, Staines.
Bond, T. W., Elstead House Gardens, Godalming.
Bowring, J. C., Forest Farm, Windsor.
Brooman-White, R., Ardarroch, Garelochead, N.B.
Burberry, H. A., Highbury Gardens, Birmingham.
Burbidge, F. W., Trinity College Botanic Garden, Dublin.
Crawshay, De Barri, Rosefield, Sevenoaks.
Cookson, Norman C., Oakwood, Wylam-on-Tyne.
Courtauld, Sidney, Bocking Place, Braintree.
Denton, J. Bailey, Orchard Court, Stevenage.
Douglas, J., Great Gearies, Ilford.
Gabriel, J. T., 6, Palace Road, Streatham Hill.
Handley, Rev. E., 19, Royal Crescent, Bath.
Haywood, T. B., Woodhatch Lodge, Reigate.
Hill, E., Tring Park Gardens, Tring.
Ingram, C., 86, Onslow Gardens, S.W.
Jaques, J., Waddesdon Manor Gardens, Aylesbury.
Kinleside, Rev. R. V. C., Sunbury House, Tunbridge Wells.
Latham, W. B., Botanic Gardens, Edgbaston, Birmingham.
Le Doux, G. R., Langton House, East Molesey.
Lindsay, R., Botanic Gardens, Edinburgh.

Low, H., The Nurseries, Clapton, E.
Lucas, C. J., Warnham Court, Horsham.
Moon, E., Cassiobridge, Watford.
Pilcher, Charles, 84, Ringford Road, Wandsworth, S.W.
Pollett, H. M., Fernside, Bickley, Kent.
Sander, F., St. Albans.
Smee, H. J., Wallington, Surrey.
Statter, Thos., Stand Hall, Whitefield, Manchester.
Tautz, F. G., Dibdin House, Hanger Hill, Ealing.
White, W. H., Burford Lodge Gardens, Dorking.
Williams, H., Victoria Nurseries, Holloway, N.

NARCISSUS COMMITTEE.

(Established 1885.)

Chairman.—Professor M. Foster, Sec. R. S., Shelford, Cambridge.

Vice-Chairmen.—Baker, J. G., F.R.S., Royal Herbarium, Kew; Dod, Rev. C. Wolley, Edge Hall, Malpas, Cheshire; Engleheart, Rev. George H., Appleshaw, Andover; Wilks, Rev. W., Shirley Vicarage, Croydon.

Honorary Secretary.—Scrase-Dickins, C. R., Coolhurst Park, Horsham.

Barr, P., 12, King Street, Covent Garden, W.C.
Barr, W., 12, King Street, Covent Garden, W.C.
Bennett-Poë, John T., 29, Ashley Place, S.W.
Bourne, Rev. S. E., Dunston Vicarage, Lincoln.
Burbidge, F. W., Trinity College Gardens, Dublin.
Clarke, Col. R. Trevor, Welton Place, Daventry.
Collins, A., 39, Waterloo Road, S.E.
Cowan, C. W., Valleyfield, Penicuick, Midlothian.
Darlington, H. R., Cromdale, Marlboro' Hill, Harrow.
De Graaff, S. A., Leyden, Holland.
Elwes, H. J., F.L.S., Colesborne, Andoversford, Gloucestershire.
Goldring, W., 52, Gloucester Road, Kew.
Grosvenor, Lady Hy., 73, South Audley Street.
Hartland, W. B., Ard-Cairn, Cork.
Haydon, Rev. G. P., Hatfield Vicarage, Doncaster.
Jekyll, Miss G., Munstead, Godalming.
Jenkins, E. H., Queen's Road, Hampton Hill, S.W.
Krelage, J. H., Haarlem, Holland.
Leichtlin, Max, Baden-Baden.
Llewelyn, Sir J. T. D., Bart., F.L.S., Penllergare, Swansea.
MacMichael, Rev. C., Walpole Rectory, Wisbech.
Marsh, Rev. T. H., Causton Rectory, Norfolk.
Milne-Redhead, R., Holden Clough, Bolton-by-Bowland, Clitheroe.
Moore, F. W., Royal Botanic Gardens, Glasnevin, Dublin.
Perry, Amos J., Stamford Road, Page Green, Tottenham.
Vilmorin, Henry L. De, Quai de la Mégisserie, Paris.
Walker, James, Ham Common, Surrey.
Ware, Walter T., Inglescombe Nurseries, near Bath.
Webster, A. D., F.B.S.E., Holydale, Keston, Kent.
White, Miss, Alexander College, Dublin.

NOTE.—Five Members form a quorum in all of the Committees. Members of the Council are Members of all the Committees.

THE KAKI.

(SEE FIG. 10.)

IN reply to your correspondent "X.," I would say my communication was intended for the majority of your readers to whom I believe the Kaki is an unknown fruit. I have asked for it repeatedly in some of the largest gardens and fruiterer's shops in England, and the reply is almost invariably "we do not know it." Only once have I seen it in fruit in England on an open wall, and that was in Canon Ellacombe's garden at Bitton. If "X." will refer to De Candolle's *Prodomus*, vol. viii., pp. 228, 229, or Nicholson's *Dictionary of Gardening*, vol. ii., p. 479, he will see the difference between Diospyros Kaki and D. virginiana (the Persimmon); both fruits ripen in my garden, and I consider the Kaki far superior to the Persimmon.

Needless to remark that this fruit though rare in England is common in some parts of the world. I have eaten the Kaki for years in China, where it is quite common, both fresh and dried. In the Department of the Var it is becoming common, but in this part of Italy it is almost unknown, though fairly abundant at Florence. The word Kaki is from *Chaki*, the Japanese word for the fruit, while the Chinese call it Sze Tsze. *Thomas Hanbury, La Mortola, December* 31, 1892.

HOME CORRESPONDENCE.

CATTLEYA WAROCQUEANA ALBA.—I think it is only just to L'Horticulture Internationale, Brussels, to reproduce what was said nearly two years ago under the name of Cattleya Warocqueana alba. This appears in *Gardeners' Chronicle*, March 7, 1891, and runs as follows:—"When reporting on the new Cattleya Warocqueana, the collector stated that there were among the specimens found some which had flowers of the purest white; and the verification of this statement has just been afforded by the flowering of a white variety of surpassing beauty in the collection of M. G. Warocqué at Mariemont, near Charleroi." *P. Weathers.*

HAMBURGH PARSLEY.—One finds this type of Parsley in seed lists, but rarely in gardens, and it is only occasionally mentioned in gardening books. It is regarded by many as a variety of our common Parsley, which it resembles in some points, but differs widely from in others, being of taller and more spreading growth, forming a large root, which is the portion of the plant used for culinary purposes. The root takes somewhat the form of the Parsnip, but is much smaller and shorter; a good-sized root being about 2 inches in diameter, and from 6 to 8 inches long, the flesh being white and somewhat dry; it is like the Celeriac in flavour, but is said to be not so delicate. It has a somewhat limited use as a culinary vegetable, and is employed in sauces for fish and flesh meats, soups, &c. Being a very hardy plant, the roots can be left in the open ground, and dug up in the same way as is customary with Parsnips. The foliage resembles a somewhat coarse form of the common Parsley, and was perhaps obtained from a plant having a large root. Why it is called the Hamburgh Parsley is not quite clear, probably it originated or was grown in the neighbourhood of that city, and it appears to be largely cultivated in Germany. Messrs. Vilmorin & Co. mention there are two forms of it grown in Germany; one is an early one, having thicker and more fleshy roots, like those of the common Parsnip, while the late one has longer and more slender roots, and they say they do not appear very constant, so doubtless one is but a selection from the other, and in respect of weight of produce the difference is very slight. It is a plant requiring a fairly rich deeply dug soil, and the culture resembles that of the Parsnip. Some leave the roots in the ground as they do their Parnips; others lift the roots in October, and store them away in sand for use. Hamburgh Parsley appears to be a vegetable of comparatively modern introduction to this country. *R. D.* [Patches of the plants covered with frames having a lining of litter and matted at night to keep out frost, will furnish a supply of leaves for kitchen use when the curled leaved varieties cease to grow outside; and roots, if taken up in early October, and the larger leaves cut off and laid in layers in a bank of sand or loam, with the heads just projecting beyond the face of the bank, will furnish good materials for flavouring all through the winter. The bank may be made in a cold pit or light cellar, where frost does not penetrate. ED.]

IRIS ALATA.—I venture to send you some blossoms of Iris alata var. speciosa, which I think is one of the most beautiful of all Irises. The little line of gold has such great effect. Moreover, their habit of blooming in mid-winter very much enhances their value. I prefer them even to Xiphion histrio, on whose merits—as shown the other day by Mr. Ware—you very justly expatiated. We now have a hard frost here, but almost up to the present time it has been a good season for these winter Irises. I. stylosa has been at its very best. Iris cretica has followed suit, together with Xiphion histrio in the open border, and the greenhouse has been gay with Iris alata and var. speciosa, which I think should never be forgotten where very beautiful flowers are valued in December. There are also now some very fine varieties of Iris stylosa, which can be obtained from Messrs. Dammann of Naples, which should always be grown. *H. Ewbank.*

CYANOPHYLLUM MAGNIFICUM FROM SEED.—This fine plant was once a favourite with exhibitors of fine foliage plants, as also was Sphærogyne latifolia, but owing to the large size to which they grow in a short space of time, many gardeners have given up growing them, the more so, as small plants for room and table decoration are now more appreciated. If seed of Cyanophyllum could be purchased cheaply, nothing more useful as a fine foliage plant could be so readily raised; and in writing this note I hope that if seed is obtainable, it will be advertised, for seedling plants of Cyanophyllum when small, are very beautiful objects. Just previous to taking my first foreman's place, and while still a journeyman under Mr. Robinson at Englefield House, Berks, the Cyanophyllum magnificum was flowered, it being I believe the first plant which had flowered and seeded in this country, and if I remember rightly it was figured in the *Gardeners' Chronicle* in 1864 or 1865 [no]; some of the seed was sown, and plants were raised by hundreds, and in a small state they were most beautiful, and at that time were a wonder to many lovers of plants who came from far and near to see them. They were grown beneath Cucumber plants, and resembled, whilst still small, a huge bed of Anæctochilus. Some years afterwards, when serving as foreman in France, Mr. Robinson, of Englefield, sent me some seed, but I failed to get it to germinate, and after leaving Englefield, I never heard of or saw any more seedling Cyanophyllums. *W. C. Leach, Albany Park Gardens, Guildford.*

MUSCAT CHAMPION GRAPE.—This Grape was raised by the late Mr. Melville of Dalmeny, not by Mr. Meredith, as stated in the account of Keele. Mr. Melville exhibited it in London, and was awarded a First-class Certificate. The late James Veitch bought it for £100. That this Grape is a true cross between the Canon Hall Muscat and the Hamburgh is proved by its colour (red), foliage, and keeping qualities. The foliage is more like the Muscat, and it also takes its keeping qualities from the Muscat. The Vine succeeds best if inarched on the Muscadine; it does not do so well on its own roots. Although it was well shown in London by Mr. Carmichael when he was at Sandringham, nevertheless the prejudice against its colour prevented it from making any headway, much to Mr. James Veitch's disappointment. *Vagabond.* [The reasons for this variety, in spite of its undoubted good quality, not finding much appreciation are, beyond that one mentioned by our correspondent, its bad keeping quality after being quite mature. It was raised in 1858. ED.]

THE WEATHER IN SUSSEX.—The weather of the past week has been unusually severe. On Monday, the 2nd, the minimum temperature was 7°, maximum, 25°. On Tuesday, the 3rd: min., 0°; max., 27°. Wednesday: min., 1°; max., 32°. Thursday: min., 0·1°; max., 30°. Friday: min., 22°; max., 32°. Saturday: min., 22°; max., 28°. It will be seen from the above, that the past week has been the coldest we have had here since 1880. Only once last year did the thermometer reach zero, and that only for about an hour. With such weather, it is difficult to keep up heat in forcing-houses. *H. C. Prinsep, Buxted Park.*

VINE-DRESSING AND PETROLEUM OIL.—The time having come round when the rods of the Vine receive their annual cleaning and dressing for the destruction of insects which lodge about the bark and gnarled spurs, it may interest some growers and be profitable to others if I give my experience of petroleum in this operation. It is agreeable to speak of success, but to mention failure through bad management is quite unusual. Nevertheless, an account of any mismanagement in an operation is very effectual in preventing others from making similar blunders. It is the desire of most Grape-growers, especially exhibitors of Grapes, to have the Vines thoroughly clean and free from insects which prey upon the leaves and disfigure the berries, and reducing the chances of securing fine colour and perfection in the fruit. Numerous sorts of mixtures and solutions are used as a winter dressing which do no harm to Vines, and which also fail to eradicate red-spider and other insects. It has been my practice for many years to clean the interior of the vineries by washing or painting the woodwork, removing several inches of the surface of the border, and scraping and painting the Vines with various mixtures; yet red-spider has always been more or less present at midsummer. Being convinced that the parents owed their existence to the cover provided by the bark, I determined to try an application of petroleum, at the rate of one wineglassful with two ounces of black (soft) soap to the gallon of water, a solution

I have used for many years with fair success on different kinds of plants; and in every case I applied it with a syringe, keeping it well-stirred the while. In this instance, however, the oil was put in while the soap-water was boiling, and when cold enough to handle it was applied to the rods with a woollen cloth. I may mention that the directions given to stir well was not exactly carried out, the solution being rather hot, the cloth being dipped on the surface only, and then rubbed on the Vines. The result was that the first two Vines washed in each house were killed almost to the ground, while some of the rods next them were more or less damaged. A fresh supply was provided for each of the three houses, which accounts for the separate damage done. The injury was not discovered till the Vines were several weeks started, and the sap consequently in motion. They were then cut down to within 2 feet of the ground, and being robust canes, they bled profusely for three weeks, although the cut was several times burned, and covered with a styptic. They afterwards started below the cut, and made extra-strong growth, with the exception of two, one of which was entirely killed, while the other started from beneath the surface of the soil about midsummer, and being late it ripened badly. It would be interesting to know

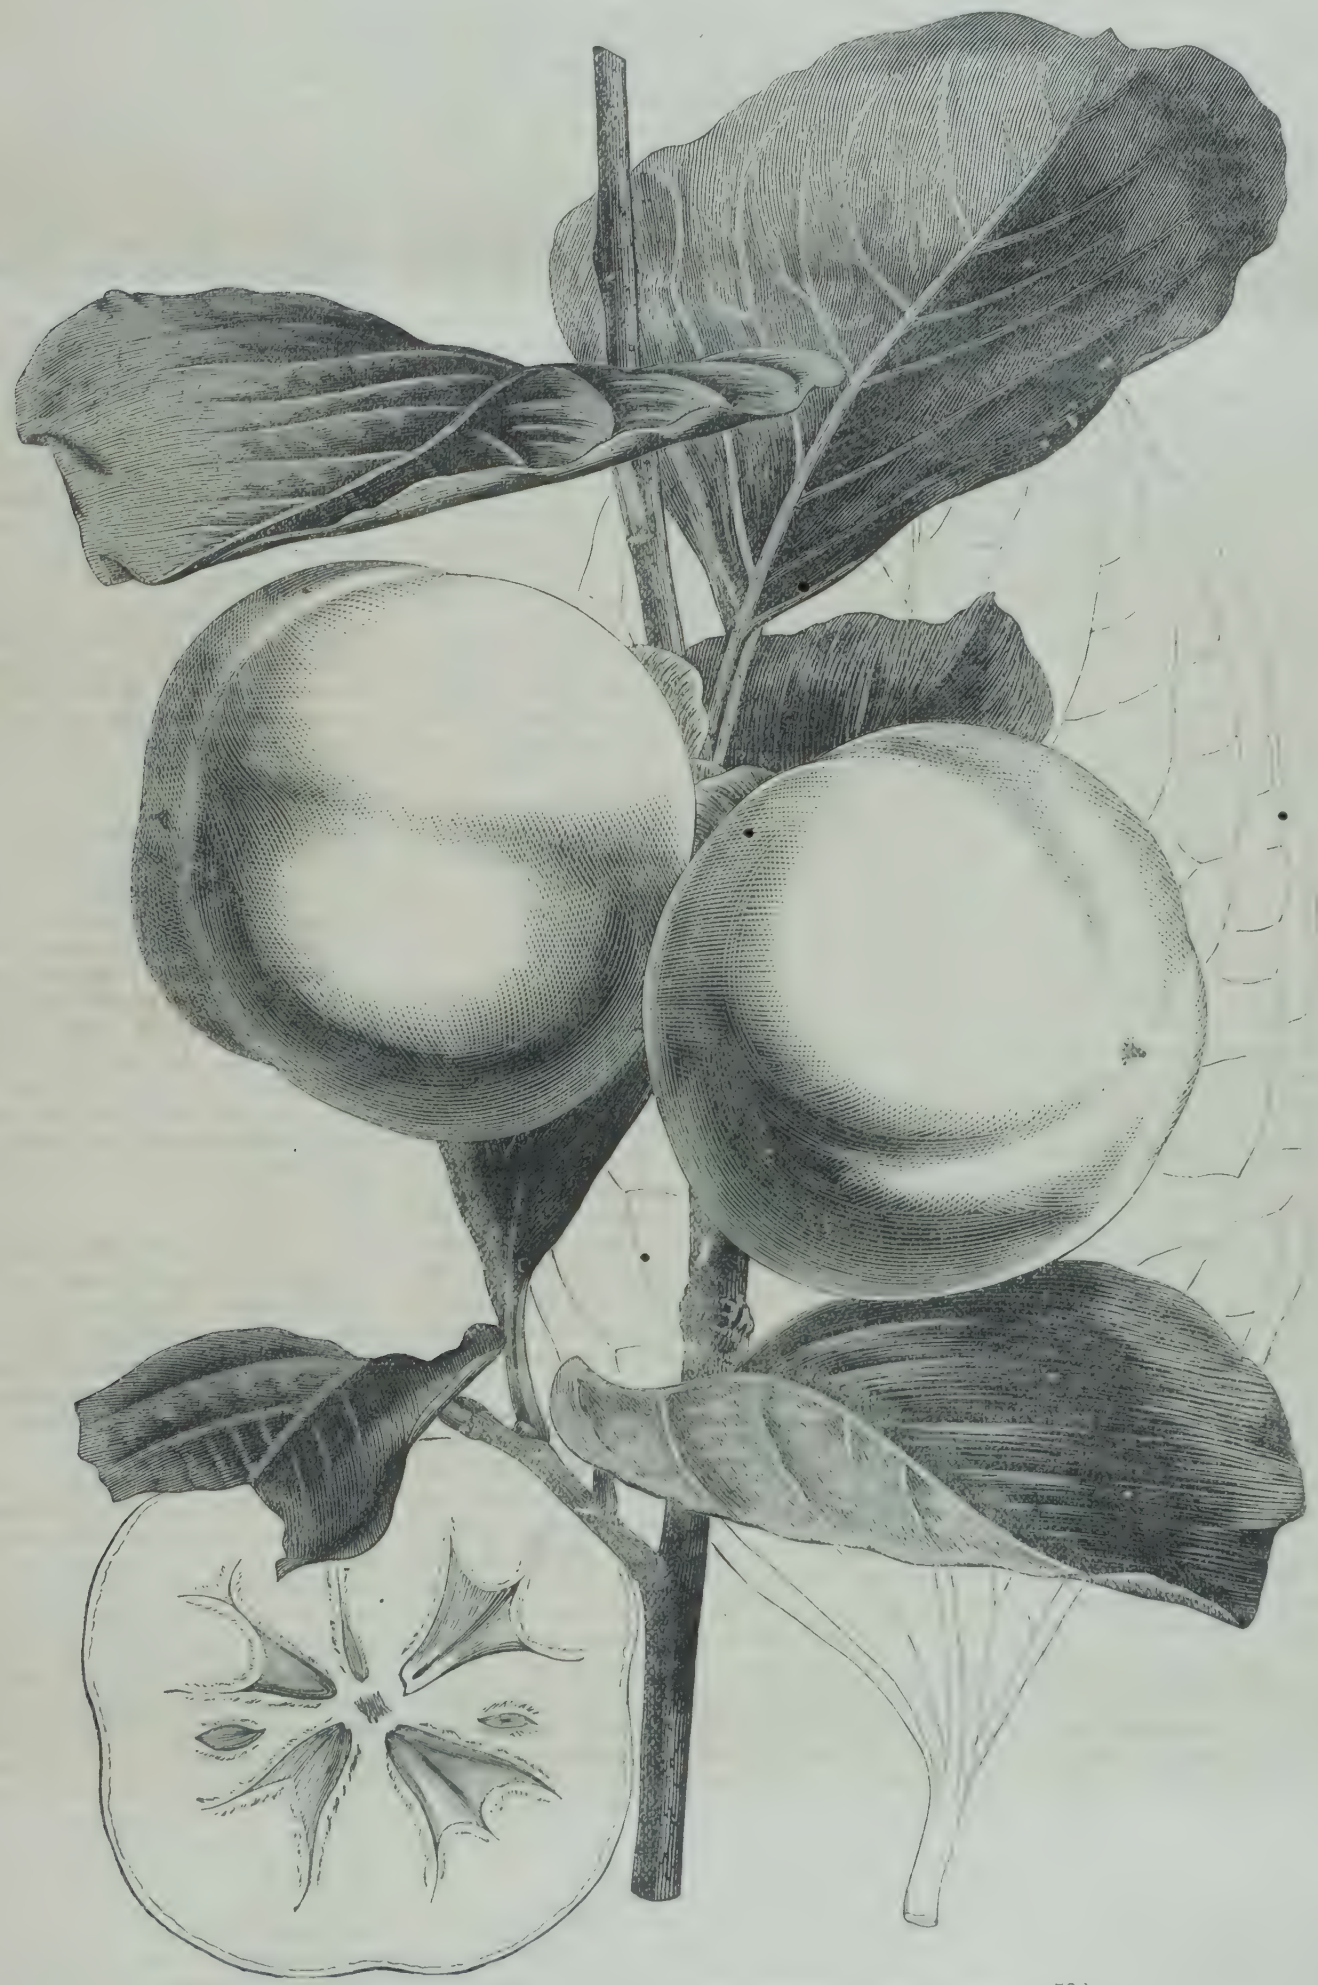

FIG. 10.—FRUITS AND SHOOT OF DIOSPYROS COSTATA, "KAKI." (SEE P. 50.)
(After a coloured plate in the *Revue Horticole*.)

why petroleum may be used on Peaches, Figs, and many other plants with perfect safety, in the manner I have described, while numerous instances of damage has resulted to Vines from an application of the same solution. In relating the above experience to a prominent horticulturist, he said, "I may paint the rods with pure petroleum when they are in active growth without danger of doing them harm; but when applied to dry dormant rods, it was very injurious." I washed a pot Vine when in full leaf with the solution abovementioned without any apparent ill-effects. Probably some of your scientific readers will be able to explain its action on dormant and active plants. In dealing with insects, I may here mention a matter which has been for some time a source of trouble, and, I may say, of mystery, to me and many other exhibitors of white Grapes. It may be often observed at exhibitions that the berries of White Muscat, Foster's Seedling, &c., are disfigured by a cluster of small brown specks at the apex of the berries, and sometimes also around the footstalks. From observation, I have come to the conclusion that this is caused by red-spider piercing the skin, as it is impossible to remove the spots by rubbing [or thrips. ED.]. When Vines are badly infested, the spider may be seen working on the berries, as well as on the leaves; but so far as I know, the disfigurement mentioned has never been traced to their action. Our Muscats this year have been quite clear of red-spider, as well as the spot; not, however, from the excessive use of petroleum on the rods, but from continued and careful application of clear water through the syringe. *William Williamson, Tarvit Gardens, Cupar, N.B.*

THE GARDENERS' ORPHAN FUND.—The announcement just made that there are seven candidates for assistance from this Fund beyond the eight to be elected should give additional stimulus to the appeal to the gardeners of the United Kingdom, which Mr. Crump has recently made. How few gardeners would be the poorer for the annual contribution of 5*s*. How much the poor orphans that must otherwise be rejected would be the richer. May I suggest that the gardening Press agree to unite in making special appeals to gardeners especially and others in general, early in the new year for the Orphan Fund, and at midsummer or thereabouts, on behalf of the Gardeners' Benevolent Fund. Why not have simultaneous Press appeals as now we have for hospitals, and simultaneous pulpit appeals. So far as the Gardeners' Royal Benevolent Institution is concerned, the new rules as to cumulative votes for subscribers, should give additional stimulus to subscriptions to that Fund from gardeners, but some other method than annual payments is needful. In the case of the Orphan Fund, no such stimulus is possible; the entire proceedings in relation to it being due to pure benevolence. To maintain seven other orphans on the Fund, means an annual expenditure of £91. If but 500 other 5*s*. subscribers could be secured, that would give an additional £125 yearly, leaving a good margin to accumulate for contigencies. But a general Press appeal might result in securing fully double that number of new annual subscribers; and if one-third paid 10*s*. yearly, what a splendid permanent addition would be made to the Fund's income! It is not so much the regular subscribers as the non-subscribers who should respond. *A. D.*

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The above worthy institution comprises many members as gardeners, but it is rather surprising to me that there are not more, considering the large number of gardeners in this country. Also there are many gardeners quite ignorant of the existence of such an institution. [Do gardeners never read?] Another thing which surprises me is, that out of twelve to be elected this time for the pension, only two are really eligible. I therefore beg to suggest that the annual sum should be £4 a year less to those who are elected and have never paid a penny towards the fund. Also I suggest that the committee should alter the fifteen years to twelve years for enabling life members to be eligible; it may be the means of gaining more subscribers. *A. J. L., Wyfold Court, Reading.*

NOVELTIES OF 1892.

(Continued from p. 10.)

THE term novelty must not be too critically regarded, for in these short notes we must necessarily include many things which are re-introductions coming out prominently during the year, and so far as gardens are concerned, quite worthy to take their place among the things which seem to show a better title to being regarded as new.

FERNS.

These plants seem to be steadily increasing in favour, and in the great Fern nursery of Mr. H. B. May, at Upper Edmonton, many new varieties are annually raised. Among those which have best displayed their work in 1892 are Adiantum elegantissimum, a form of A. æmulum, with ample fronds, having very small laxly-set pinnules. A. cuneatum grande, intermediate between A. cuneatum and A. decorum; Nephrolepis davallioides multiceps, a variety of N. d. furcans, but more divided and elegant; N. recurvata, with curiously-curled pinnæ; Pteris serrulata gracilis, an elegant new Fern, and some charming varieties obtained from P. Victoriæ, and forms of P. serrulata, in which the variegation of both plain and crested varieties is much finer. These are P. reginæ, a lovely plant, whose silvery marking on the fronds extend almost to the margins; P. r. cristata, a beautiful crested form of the preceding; and P. nivalis, which has the strong habit of P. serrulata, with the clear white variegation of P. Victoriæ. P. tremula variegata, and that beautiful Fern ally, Selaginella elegans, have, with the others enumerated, received Certificates at the Royal Horticultural Society.

Messrs. W. & J. Birkenhead, of Sale near Manchester, who wholly turn their attention to Ferns and ferneries, sent out some beautiful forms during the past year in Athyrium filix-fœmina var. Girdlestonei cristatum, A. f.-f. var. G. grandiceps, A. f.-f. selligerum corymbiferum, A. f.-f. s. var. Victoriæ, Lastrea æmula densa, Scolopendrium vulgare var. crispum fimbriatum, and S. v. var. digitatum majus; and Mr. Lowe and Mr. C. T. Druery, have both shown fine new hardy Ferns, the forms of Athyrium f.-f. Drueryi rivalling in beauty the finest tropical species; and A. f.-f. revolvens being a very curious one. The Pteris tremula densa of Messrs. Smith, of Worcester, seems also to be a beautiful as well as useful decorative plant.

STOVE AND GREENHOUSE PLANTS.

These have been augmented chiefly by the products of the hybridist, and in that field Messrs. J. Veitch & Sons have been active workers, as in former years, although the excellence of their work previously done makes difficulties for themselves in regard to further improvement. Of their grand strain of Amaryllis some dozen or so were admitted by competent judges to be fine novelties, and of those the best were Eclipse, Crimson King, Sylvia, Orion, and Argus. The pretty race of Streptocarpus is rapidly finding favour in the eyes of cultivators, and the brighter colours being now constant, it is possible to divide them into sections. Gloxinias are still being worked up by Messrs. J. Veitch & Sons, and among their novelties are Hector, Aida, and Cicely, all very distinct and beautiful. Of their famous strain of greenhouse Rhododendrons, the new double R. balsaminæflorum varieties are much sought after, and for neat habit their R. multicolor varieties are all that could be desired, R. m. Neptune, a fine crimson, being one of the best. The pretty dwarf hardy Rhododendron racemosum should be very useful, both as a greenhouse and as a hardy plant. Other good plants of Messrs. J. Veitch & Sons, are Grevillea robusta elegantissima, Aglaonema costata, Begonia Marie Louise, B. decora, and the nearly white Vallotta purpurea amabilis.

Following the pretty yellow spotted Calla Elliottiana, which made good its claim to notice by a group of it being awarded a Silver Banksian Medal at the last Temple Show of the Royal Horticultural Society, we have another good yellow in C. Pentlandii, introduced by R. Whyte, Esq., of Pentland House, Lee; and yet another under the name "Pride of the Congo" has been sold at auction; while M. Deleuil, of Marseilles, has raised a hybrid yellow Calla (Richardia aurata), and others are said to be forthcoming, so that in this instance the demand has been followed as is customary by an increased supply—let us hope that the articles will be all found according to description.

With Messrs. B. S. Williams & Son, their fine Allamanda Williamsii has exceeded even their expectation; some good new Amaryllis and Imantophyllums have been flowered by them; and they have received awards for the two pretty-coloured Dracænas, D. Coullingi and E. Princess May.

Messrs. John Laing & Sons and Messrs. Cannell still continue to offer novelties in tuberous Begonias of considerable merit; and the fine show of Chinese Primulas made by Messrs. Cannell at the Royal Horticultural Society in January last, out of which P. s. Pink Queen and P. s. Peach Blossom were certificated, show that there are still further possibilities of new beauty in this favourite florist's flower. At the different shows, too, Messrs. Laing & Sons exhibited some fine new Bertolonias, Caladiums, Dracænas, and Crotons.

Messrs. Paul & Son, of Cheshunt, far from confining themselves to their specialty of Roses, have a fine and distinct strain of Amaryllis, of which Mars, Silver Queen, and Firebrand secured Royal Horticultural Society Certificates during 1892. The same firm is also doing good work on the showy-flowered Cannas, and especially the dwarfer strains.

Other good things which have come into prominence during the past year are Tacsonia Smythiana× of Mr. Smyth, Basing Park Gardens, Alton; Dracæna australis rubra of Mr. Elliott, Stourvale, Christchurch; Anthurium Andreanum sanguineum of Sir Trevor Lawrence, Bart.; Utricularia Humboldtii and U. longifolia, imported by Messrs. Sander; Tradescantia regina, and other pretty foliage plants introduced by Messrs. Linden; Kniphofia paucifiora, a fine yellow species flowered at Kew, and K. Nelsoni, Mast.; described in the *Gardeners' Chronicle;* the extraordinary bi-generic hybrid, Urceocharis Clibrani, of Messrs. Clibran, Altrincham, also figured in the *Gardeners' Chronicle;* Streptocarpus Galpinii from Kew, Cyrtanthus Tuckii and C. Galpinii, and a number of others, of which more will be known by next year. Among other attempted introductions should be noted Trichodesma physaloides, figured in the *Gardeners' Chronicle*, p. 363, vol. xi., which would make a fine garden plant, but of the thousand imported, probably not half-a-dozen plants are now alive.

HALF HARDY AND HARDY FLOWERS.

Nemesia strumosa, the fine strain of which, with its varied colours, ranging from cream-white to orange-scarlet and crimson, was so generally admired when it was so well exhibited by Messrs. Sutton & Son of Reading, is a most valuable introduction, for it is a plant easy to cultivate, free to flower, and of brilliant colours.

Come chiefly from the raisers of garden varieties, of these there has been a great show of Pæonies from Messrs. Dicksons of Chester, Paul & Son, Ware and others, at the Chiswick Gardens of the Royal Horticultural Society on June 14, when there was a good general show of flowers for the open garden. Carnations, always favourites, continue to be raised by Mr. Charles Turner of Slough with unvaried success; last year, specially good being the varieties King of Scarlet and Salamander, and Picotees Nellie Bath, Old Coin, Duchess of Sutherland, and Mrs. Arthur Barrett. Messrs. Pearson of Chilwell showed a good thing in Carnation Acme; as were Carnation George Fry, shown by Messrs. John Laing & Sons; C. Mrs. A. Hemsley, and C. Cyril by Mr. H. B. May, and C. Baronne Rothschild, and Mrs. Leopold Rothschild—all good things in their different sections.

Messrs. Dobbie & Co., Rothsay, Fife, N.B., continue to work wonders with their rich strains of Violas, French Marigolds, and the other popular flowers to which they give special attention; and Messrs. Kelway are successful as ever with Gladioli, Delphiniums, Gaillardias, &c. By the way, a pretty thing was flowered by the Rev. W. Wilks, of Shirley Vicarage, Croydon, and the Rev. E. Arkwright, in Gladiolus byzantinus albus, a white form of the favourite garden Gladiolus.

To enumerate the new Chrysanthemums, Dahlias, &c., would be a very heavy task. Suffice it, therefore, to say, that good progress is shown in all classes, and the garden work of 1892 gives a very good account of itself, although we should have liked to have had more really distinct and new hardy trees and shrubs, and flowering shrubs for the open ground put in an appearance.

Among novelties and uncommon plants illustrated in the *Gardeners' Chronicle* in 1892, are:—

Athyrium f.-f. revolvens, September 10, p. 301.
Cyrtanthus Tuckii, August 6, p. 155.
Emmenantha penduliflora, March 12, p. 339.
Humulus japonicus variegatus, October 8, p. 429.
Iris Lortetii, August 6, p. 153.
Kniphofia Nelsoni, April 30, p. 561.
Kniphofia pauciflora, July 16, p. 65.
Nemesia cynanchifolia, for comparison, p. 276.
Nemesia strumosa vars., September 3, p. 277.
Nepenthes stenophylla, March 26, p. 401.
Rhododendron balsaminæflorum, December 24, p. 769.
Rhododendron racemosum, July 16, p. 63.
Streptocarpus Galpini, January 30, p. 139.
Tacsonia Smythiana ×, December 10, p. 704.
Thrinax Morrisii, January 23, pp. 112, 113.
Tradescantia regina, May 28, p. 699.
Trichodesma physaloides, March 19, p 363.
Urceocharis Clibrani ×, August 20, p. 215.
Watsonia iridifolia O'Brienii, July 16, p. 63.

FRUIT REGISTER.

APPLE JAMES GRIEVE.

THIS new dessert Apple was sent out a few years ago by Messrs. Dickson & Co., Edinburgh, and named after their manager, to whose skill as a raiser of new fruits (especially Apples) it bears good testimony. As grown here upon the broad-leaved paradise stock, it has proved excellent in regard to quality and productiveness. The fruit resembles Cox's Orange Pippin in flavour, and the rich colouring of the flesh; but, it is considerably larger, and of a more conical form, and after being gathered for a few weeks, assumes a much brighter colour. Season from September to January, forming a fitting link between the early autumn Apples and Ribston Pippin. The tree is a vigorous and healthy grower, and without, so far as my observations go, any disposition to canker, which affects Cox's very badly in some parts. The variety will in time be much sought after, and prove to northern growers of equal value to Cox's in the south. *James Day, Galloway House Gardens, Garliestown.*

NURSERY NOTES.

MESSRS. B. S. WILLIAMS & SON.

The Paradise and Victoria Nurseries of Messrs. Williams never fail to reveal some features of interest, some plant or flower that is rare or beautiful, and shall we say "old," that has found a refuge here, and therefore stands a chance of resurrection some day. Amongst plants in flower, mention must be made of Eucharis candida which has the merit of flowering really well in small pots, 48's, every bulb producing a flower-spike. The bulbs are some of an importation, and are doubtless, well-matured, hence their general floriferousness. Eucharis Sanderiana is almost the equal of E. candida in the latter attribute, and some flowers of it were observed nearly as large as those of E. amazonica, and, although it may be heresy to say it, with much more substance in the segments and tube, hence their dead white.

The gorgeous inner-leaves of Nidularium fulgens were making themselves visible. It is a pity this and other Bromeliads do not meet with more favour on this side of the water. Of Alocasias, beautiful in their leaf-markings, though they are much neglected, here is one of the finest collections in the country in which to pick and choose from. The best of all Dracænas for the table—dinner-table or other—and with great enduring powers, is D. gracilis, of which a nice stock was noticed. Dracæna Coullingi, an English seedling with green foliage, broad, and semi-erect, boldly striped and bordered with white, is a good plant—one of the best of its class, and still rare; D. considens is a pendulous, narrow-leaved variety, with narrow leaves 2 feet long—very pretty. Another enduring house-plant is Raphis humilis, a very graceful Palm, with the hardiness of Chamærops humilis; a perfect miniature plant, with true well-developed leaves, standing not more than 1 foot high.

A plant which is sure to take the popular fancy, is Poinsettia pulcherrima, with leaves margined with a broad irregular band of a yellow colour; the flowers and bracts being normal. Of Orchids in flower, mention may be made of those of which the fogs have spared the bloom, and Holloway, although situated on our northern heights, can boast of as bad a description of fog as Southwark. Odontoglossum superbissimum is a very starry flower, with some redeeming brown patches, and rather narrow sepals and petals. We opine that Orchid naming needs revision in face of our latter-day acquisitions, the superbums and superbissimums of forty or fifty years ago being now of small account. We observed some choice types of O. crispum are about to open their flowers; also of O. Chestertoni in some numbers. Flowers were open of the new cross-bred Cypripedium Adonis, C. Spicerianum × Harrisianum, and of C. Pitcherianum, in which the parentage is the same, but reversed. The latter is a fine showy, strong-growing variety, and both have pleasing tints and markings. Nice plants of C. œnanthum superbum were in bloom, C. Williamsi opening theirs; whilst those of C. Measuresianum, which are almost of an orange-yellow when mature, were going off. The pretty C. amandum of Mr. Bull's introduction was nicely in bloom; it is very prettily spotted on the petals. C. Fitchianum was flowering freely, as is its wont, and also C. Morganiæ, of which it is rare that a plant is not found with some blooms upon it. Of others we may mention C. politum and C. Harrisianum. The fog had spared some flowers of Lælia anceps Stella and L. a. Sander's var., almost the loveliest things there. The white form of Odontoglossum Rossi, named albens, had still a few flowers left—a delicate little bloom, but we prefer the type.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

BREDEMEYER, BOOS, SCHOLL.

THESE collectors were despatched to various parts of America, and the two latter also to the Cape, in 1783—1785, by the Emperor Joseph II., to collect plants and other objects of natural history. Their comings and goings are known, but little is known of the plants introduced by them. Scholl is said to have returned from the Cape with very large collections, and amongst them numerous succulents. Any further information regarding the plants introduced by these collectors will be welcome to *Eug. de Duren.*

MARKETS.

COVENT GARDEN, January 12.

MARKET still quiet, with good supplies. Prices generally unaltered. *James Webber, Wholesale Apple Market.*

POTATOS.

The weather being more favourable, farmers are loading freely, and stock is increasing. Prices still continue firm. Best samples, 90*s.* to 100*s.*; ordinary kinds, 55*s.* to 60*s.* *J. B. Thomas.*

SEEDS.

LONDON: *Jan.* 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that there is now more business doing in seeds. Increased attention is being given to samples of German Red. French Clovers are, of course, this season quite out of the running. Prices from America come very strong. Alsyke (White) and Trefoil unchanged. Rye-grasses tend upwards. For Peas and Haricots there is an improving inquiry. Spring Tares continue very cheap. Canary seed is dearer. There is no change in Hempseed. Mustard and Rapeseed keep firm. Linseed steady. The Board of Trade Returns just issued give the imports into the United Kingdom for the past year of Clover and grass seeds as 297,323 cwt., value, £335,125; as against 256,920 cwt., value, £353,977, for 1891.

FRUITS AND VEGETABLES.

BOROUGH, *Jan.* 10.—Quotations:—Cabbages, 3*s.* to 3*s.* 6*d.*; Savoys, 4*s.* per tally; Cauliflowers, 1*s.* to 2*s.* per dozen; Spinach, 1*s.* 6*d.* to 2*s.* per bushel; Sprouts, 1*s.* 9*d.* to 2*s.* per half-sieve; Carrots, 2*s.* 6*d.* to 3*s.*; Turnips, 1*s.* 6*d.*; Parsley, 4*s.* per dozen bunches; English Onions, 6*s.* to 7*s.*; Dutch do., 5*s.* to 6*s.* per cwt.; Horseradish, 1*s.* 6*d.* to 1*s.* 9*d.* per bundle; English Apples, 2*s.* 6*d.* to 10*s.* per bushel.

SPITALFIELDS: *Jan.* 10.—Quotations:—Collards, 2*s.* to 3*s.*; Savoys, 4*s.* to 6*s.*; Cauliflowers, 8*s.* to 10*s.* per tally; Curly Kale, 1*s.* to 1*s.* 6*d.* per bushel; Sprouts, 1*s.* 6*d.* to 2*s.* per half-sieve; Turnip-tops, 2*s.* to 2*s.* 6*d.* per sack; Seakale, 1*s.* 6*d.* per punnet; Greens, 2*s.* to 3*s.*; Turnips, 2*s.* 6*d.* to 3*s.*; Carrots, 2*s.* to 3*s.*; Parsley, 3*s.* to 4*s.* per dozen bunches; Parsnips, 8*d.* to 10*d.* per score; Celery, 1*s.* to 1*s.* 3*d.*; Horseradish, 1*s.* 6*d.* to 1*s.* 9*d.* per bundle; Beetroot, 1*s.* to 1*s.* 6*d.*; Cucumbers, frame, 3*s.* to 6*s.*; Leeks, 1*s.* 6*d.* to 2*s.* per dozen; English Onions, 7*s.* to 8*s.* per cwt.; Spanish do., 6*s.* to 8*s.* per case; Belgian and Dutch do., 5*s.* to 6*s.* per bag of 110 lb.; bag Turnips, 2*s.* 6*d.* per bag; English Apples, 2*s.* 6*d.* to 6*s.* 6*d.* per bushel; American do., 10*s.* to 17*s.* per barrel; Tomatos, foreign, 1*s.* to 1*s.* 6*d.* per box; forced Rhubarb, 1*s.* 3*d.* to 1*s.* 6*d.* per dozen bundles.

FARRINGDON: *Jan.* 12.—Quotations: — Turnips, 3*s.* per bag; Carrots, 3*s.* 6*d.* do.; Parsnips, 4*s.* per cwt.; Sprouts, 1*s.* 6*d.* per half-sieve; English Onions, 7*s.* 6*d.* per cwt.; Spanish, do., 5*s.* 6*d.* per case; Parsley, 2*s.* per bushel; Apples, American, greenings, 12*s.* to 14*s.* per barrel; Horseradish, 1*s.* 9*d.* per bundle; Grapes, 16*s.* 6*d.* per barrel.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending January 7, and for the corresponding period last year:—
1893: Wheat, 25*s.* 10*d.*; Barley, 24*s.* 9*d.*; Oats, 16*s.* 8*d.*
1892: Wheat, 36*s.* 2*d.*; Barley, 29*s.* 2*d.*; Oats, 20*s.* 6*d.*

POTATOS.

BOROUGH: *Jan.* 10.—Quotations:—English Magnums, 50*s.* to 65*s.*; Hebrons, 60*s.* to 70*s.*; Snowdrops, 60*s.* to 75*s.* per ton.

SPITALFIELDS: *Jan.* 10.—Quotations:—Main Crop, 70*s.* to 95*s.*; Imperators, 60*s.* to 70*s.*; Regents, 55*s.* to 70*s.*; Magnums, 55*s.* to 75*s.* per ton.

LONDON AVERAGES: *Jan.* 11.—Magnums, 55*s.* to 75*s.*; Hebrons, 60*s.* to 80*s.*; Imperators, 60*s.* to 70*s.*; Snowdrops, 60*s.* to 80*s.*; Regents, 55*s.* to 70*s.* per ton.

FARRINGDON, *Jan.* 12.—Quotations:—Magnums, 65*s.* to 70*s.*; Bruce do., 80*s.* to 85*s.*; Main Crop, 100*s.* to 105*s.*; Sutton's Abundance, 90*s.* to 95*s.*; Hebrons, 70*s.* to 75*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 115*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 75*s.* to 112*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 28*s.* to 44*s.* per load.

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending January 7, is furnished from the Meteorological Office:—

"The *weather* continued very cold and wintry all over the Kingdom; occasional falls of snow occurred in Great Britain and over the northern parts of Ireland, while in the south of Ireland the conditions, after being fine and dry, became very rainy. Over the inland parts of England some dense fogs were experienced.

"The *temperature* was again very low, the deficit ranging from 7° in 'Ireland, S.,' and 8° in 'Ireland, N.,' and the 'Channel Islands,' to 10° in most other districts, to 12° in 'England, E.' and the 'Midland Counties,' and to 13° in 'England, S.' The highest of the maxima were registered on rather irregular dates, and varied from 48° in the extreme south-western districts to 35° in the 'Midland Counties.' At several of the inland English stations the daily maxima were below 32° throughout the whole period. The lowest of the minima were recorded during the middle part of the week, when the thermometer fell to — 2° in 'Scotland, E.' (at Braemar), to + 2° in 'Scotland, N.' (at Fort Augustus), to 5° in the 'Midland Counties,' 7° in 'England, S.W.,' and 8° in 'England, N.E. and E.,' in most other districts the minima ranged from 10° to 14°, but in 'England, N.W.,' the lowest reading was 18°, and in the 'Channel Islands,' 20°.

"The *rainfall* was more than the mean in 'Ireland, S.' and the 'Channel Islands,' but less in all other districts.

"The *bright sunshine* was rather less than the mean in Ireland and the east of Scotland, but above it in most of the English districts. The percentage of the possible duration ranged from 23 in 'England, S. and S.W.' to 13 in 'Scotland, N.,' and 7 in 'Scotland, E.'"

NOTICES TO CORRESPONDENTS.

TO OUR READERS.—*The Editor begs leave to solicit from the readers and contributors to the Gardeners' Chronicle:—*
Short Practical Notes on Cultural Matters;
Early Intelligence of Local News likely to be of general interest;
Notes and Memoranda useful to the trade;
Specimens of New or Interesting Plants, Fruits, &c.;
Drawings or Photographs of Gardens, Trees, Flowers, &c., and which if suitable for reproduction will be utilised so far as possible.

CHRYSANTHEMUM EXHIBITORS: *W. W.* The paragraph referred to was received from the secretary of the society.

CONIFERS: *A. P.* These trees must be lifted by means of a lifting-transplanting machine, if the ball weigh more than half a ton. The soil containing the roots should be moved in a solid mass, and unless this can be done with large specimens, they will not succeed. No cutting of the branches is necessary or advisable. The removal of large trees is difficult, and should be carried out under experienced guidance.

EUCHARIS, EIGHT-PETALLED: *H. B.* Such specimens, although quite abnormal, are not rare. It may be attributed perhaps to uncommon luxuriant growth, or to the union of two flowers.

GLASS: *Chrysanthemum.* We cannot recommend dealers; the task would be very invidious. Consult our advertising columns.

HARDY ANNUALS, USEFUL FOR TABLE DECORATION, AND FOR SOWING NEAR THE SEA: *A. P.* Chrysanthemum tricolor Burridgeanum, Sweet Peas, in distinct colours; Adonis, Calandrinia speciosa, Calliopsis Drummondi, C. tinctoria, C. bicolor atrosanguinea, Candytuft, various colours; Clarkia pulcherrima, and others; Dianthus Heddewegii, Erisymum Peroffskianum, Escholtzia in variety; Godetia Lindleyana, G. Lady Albemarle, G. Witneyii, Leptosiphon densiflorus, L. aureus, Linum grandiflorum rubrum, Poppies in variety.

IMPORTED PANCRATIUMS: *K. E.* As red spider and mealy bug are likely to be on the bulbs, first remove the more loose coatings, but do not expose the bulb; especially clear them away about the neck of the bulb, dusting snuff into the crevices, or dip in a safe insecticide, or fumigate with nicotine cones, &c. Having done what is needful in this way, prepare some clean pots that will just hold each bulb by carefully crocking them, putting some rough loamy siftings to the depth of 1 inch over the crocks. For a potting soil use sandy, sifted loam three-quarters, with one-quarter leaf mould in a fine state, and sufficient sand to make the compost porous. Pot the bulbs to about two-thirds of their height below the surface, and pot firmly, leaving plenty of space for water. No water will be needed before the bulbs start, and they may be stood on a shelf in a greenhouse or frost-proof pit till February or March, when it will be time to start them; making up a hot-bed of hard tree leaves, covered with leaf-mould, plunge the pots in this when the bed has acquired a bottom heat of 85° to 90°; maintain a top heat of 60° to 70°, the lower figure at night; and never quite close the frame all night. Afford no water till the leaves have been made 3 or 4 inches long, and only then if the soil be dry. As the season advances afford more air by day, shutting up about half-past 3 P.M. after damping them, or the surface of the bed. Lift the pots occasionally to prevent too early rooting into the soil; and if the leaves touch the glass, raise the frame on bricks put under the corners. Once well rooted they may remain where they have grown, or be placed in a warm pit, for the foliage to ripen. Store in winter in a dry, moderately warm place.

NAMES OF FRUITS: *Neptune.* 1 and 3, Lord Derby; 2, Dumelow's Seedling.—*J. G.* 1, Blenheim Orange Pippin; 2, not known; 3, Round Winter Orange Pippin; 4, Cox's Orange Pippin; 5, Rosemary Russet; 6, not known; 7, King of the Pippins; 8, not known; 9, Keddleston Pippin; 10, Hollandbury.

NAMES OF PLANTS: *J. M.* Asplenium rhizophyllum.—*W. O.* 1, Lælia furfuracea; 2, Tillandsia psittacina; 3, Davallia Tyermanni; 4, Niphobolus lingua.—*J. B.* 1, Dracæna amabilis; 2, Croton angustifolius var.; 3, C. angustifolius maculatus; 4, C. Disraeli; 5, C. variegatus.—*W. R.* Stanhopea Wardiana, probably, judging from your description and the photo sent.

ORANGE WITH SEEDS OUTSIDE: *J. D.* Some malformation, to which Oranges are particularly subject.

PINE-SHOOT DYING AT THE TIPS: *D. L.* The injury to the Pines is caused by the Pine-beetle, Hylurgus piniperda (see fig. 11). The insect causes some damage to Conifers by burrowing beneath the old bark in forming a breeding-place; but the mature insects do much more by perforating the tender shoots 1 inch or more from the end for food and shelter. In the case of small trees, many beetles might be caught in October and November in the manner weevils are caught, i.e., by spreading a white cloth below an affected tree without in the least disturbing it, and having done this, give the stem a smart rap, when many of the beetles will fall on to the cloth. By repeating this work at short intervals, many of the mature beetles can be caught. The injured tips should be collected in the summer, or cut off later, allowing

Fig. 11.—1, 2, Pine shoots pierced by beetles; 3, 4, Pine beetle, natural size and, magnified; E, E, jaws; F, G, chin, with feelers, &c.

them to fall into a deepish bag, and carried away and burnt. Where large trees are concerned, not much can be done beyond removing thinnings, bark felled Pine-wood in which the insect can form breeding tunnels, and burn them forthwith. Traps may be made, says Westwood, by placing, in the month of May, a young Pine trees, cut in the previous January, not earlier, against the stems of standing timber. In these the beetles will bore their galleries and lay eggs, and afterwards these traps may be collected and burnt.

PROFITABLE FRUIT GROWING: *M. K.* Money is to be made at the business by wideawake cultivators with ready markets, but it is not a lucrative business, and we are unable to say how much money you might "save" annually. The capital at your disposal should not be less than £50 per acre, for you will have to wait several years before there are any appreciable returns from the trees and bushes, although expenses might be met in great part by the various annual undercrops of Strawberries, bulbs, &c.

AUTOMATIC DAMPER
FOR GREENHOUSES.

Dr. GEORGE WALKER, Inventor of Chrysanthemum Cup Tubes, Wimbledon, says:—"I have used your Automatic Damper for some weeks, and am perfectly satisfied with it. A most ingenious and useful invention."

Mr. H. J. JONES, Hither Green, Lewisham, who uses the Damper in a house 100 feet long, says:—"I find this damper is in every way economical. Its saves both fuel and labour, and keeps the house at a more even and better temperature."

PATENT AUTOMATIC DAMPER CO.,
97, FLEET STREET, LONDON, E.C.

FIR-TREE OIL
SOLUBLE INSECTICIDE.

The most pleasant and reliable of all insecticides for destroying insects on plants, animals, and birds. Thousands of testimonials received from all parts of the world. LE FRUITIER
The Specialty for Vine Culture.
Again the Most Successful on Record.
Used by the Champion Prize Winners during the past Season.

THE PERFECTION of PLANT FOOD.

What "LE FRUITIER" can do. **ONE of MANY UNSOLICITED TESTIMONIALS:—**

39 PRIZES OBTAINED
BY
ONE GARDENER IN ONE SEASON,
28 BEING FIRSTS;
ALSO
FIRST PRIZE of the NATIONAL CHRYSANTHEMUM SOCIETY, Open to all England;
And 10-GUINEA CUP.

The Gardens, The Priory, Hornsey, December 3, 1892.

SIRS,—You will, I am sure, have noticed my extraordinary success this season, having taken no less than **39 Prizes, of which 28 were Firsts.** The Shows at which I exhibited included the **Royal Aquarium, open to all England; the Kent Show at Blackheath; and the Highgate Show, at which, in addition, I secured the Ten-Guinea Cup, having won it two years in succession.**

I have used your Manures now for some years, and can testify to their sterling worth. I should be sorry to be without "Le Fruitier" and "Liquid Manure Powder," for I know their value both for Vine and Chrysanthemum culture.

I think it only right to say that I attribute no small portion of my success to the use of your Manures generally.

(Signed) Yours truly, EDWIN ROWBOTTOM.

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds. *January* 9, 1886.
MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.
GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.
The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.
Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably. I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, *November* 10*th*, 1886.
GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.
I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.
MESSRS. THOS. GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) G. W. BASHFORD.

HOLLOWAY'S PILLS and OINTMENT.—Influenza, Coughs, and Colds.—In diseases of the throat and chest, so prevalent in our changeable climate, nothing so speedily relieves, or so certainly cures, as these inestimable remedies. These disorders are too often neglected at their commencement, or are injudiciously treated, resulting in either case in disastrous consequences. Whatever the condition of the patient, Holloway's remedies will restore, if recovery be possible; they will retard the alarming symptoms till the blood is purified and Nature consummates the cure, gradually restoring strength and vital nervous power. By persevering in the use of Holloway's preparations, tone is conferred on the stomach and frame generally. Thousands of persons have testified that by the use of these remedies alone they have been restored to health after every other means had failed.

LÆLIA GRANDIS TENEBROSA.

ONCIDIUM MARSHALLIANUM.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and 213, Park Road, Clapham, S.W., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, January 27, at half past 12 o'Clock, a valuable consignment of newly-imported ORCHIDS, consisting of the new and handsome

LÆLIA GRANDIS TENEBROSA.

Our Collector did not exaggerate when giving a glowing description of the richness and diversity of colour. We have proved this with the plants which have flowered surpassing our most sanguine expectations.

In appearance the plant resembles Lælia purpurata, keeping the same character under cultivation, and is seemingly very free-flowering, as the plants, in our possession some considerable time, have made sheaths and improved every season; the growths are made during the summer months, and produce the flowers the following spring. The flowers are of immense size, 8 or 9 inches; petals and sepals are a brilliant bronze, varying in colour; quite recently we had one with golden-yellow sepals and petals as near as possible the colour of a good Cattleya aurea. The petals are broad, and do not reflex, as in Lælia purpurata, giving the flower a bold appearance. The lip varies considerably, some plants have a dark purple throat, others being magenta-purple, both having white veins radiating from the centre. Many old flower-spikes show up to 7 flower-seats. The plant has proved itself to be of very easy culture and free blooming; some extraordinary varieties having been flowered out of the consignment we had last year. A. Brooman White, Esq., of Ardarroch, showed at the Drill Hill one of the largest and finest-coloured forms yet seen, and it was admired by everybody who saw it.

The plants are in special fine condition, superior to any offered yet, they can be recommended with every confidence. Our collector is the only one who knows the habitat of this grand old Lælia, which is quite distinct from any other or the old small-flowered Lælia grandis.

ONCIDIUM MARSHALLIANUM.

A fine healthy consignment of this charming Orchid, very useful for show and cutting purposes.

The Sale will also include a grand lot of ECUADOREAN ORCHIDS, viz., Odontoglossum Edwardi, the Violet-coloured Odontoglot, sweetly-scented; the useful and pretty Odontossum cirrosum, and Odontoglossum Halli.

On view morning of Sale, and Catalogues had.

Wednesday Next.

The plants are in special fine condition, superior to any offered yet, they can be recommended with every confidence. Our Collector is the only one who knows the habitat of this grand old Lælia, which is quite distinct from any other, or the old small-flowered L. grandis.

ONCIDIUM MARSHALLIANUM.—A fine healthy consignment of this charming Orchid, very useful for show and cutting purposes.

Also a grand lot of ECUADOREAN ORCHIDS, namely, ODONTOGLOSSUM EDWARDII, the violet-coloured Odontoglot, sweetly scented; the useful and pretty ODONTOGLOSSUM CIRROSUM and O. HALLI.

For fuller Particulars, see Auction Columns.

EXHIBITION.

WOLVERHAMPTON FLORAL FÊTE.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

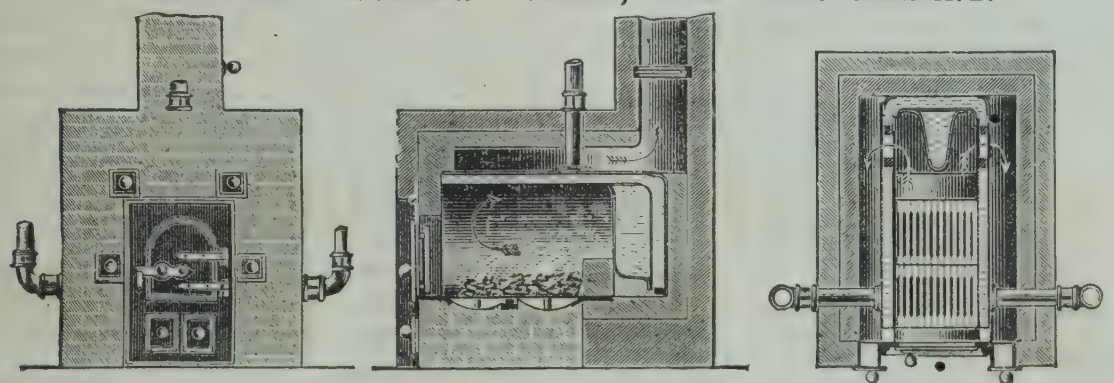
And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.



—FRONT ELEVATION— —LONGITUDINAL SECTION— —SECTIONAL PLAN—

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in *brickwork, which is necessary for this class of boiler.*

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds. *January* 9, 1886.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.

The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, *November* 10*th*, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESSRS. THOS. GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) G. W. BASHFORD.

And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

THE NURSERIES,

SAWBRIDGEWORTH, HERTS.

VICTOR POTATOS

(SHARPE'S).

This favourite first early Potato, suitable for any Garden, indispensable for Forcing and Early Borders, and likely to take the first rank amongst first earlies for market use. Quality and yield all that could be desired. One well-known market grower has this year had a yield of 15 tons per acre on a large acreage. London and Manchester salesmen speak highly of their quality, and report that Victors will keep their bloom and have a fresh appearance after being in the market some days, when other early Potatos have become discoloured and unsaleable.

The stock we offer is the true yellow-fleshed variety and not the white variety, which is often substituted.

Price per cwt. and ton. State requirements to

W. W. JOHNSON & SON,

Seed Growers and Merchants, Boston, Lincolnshire.

SMALL SHRUBS and CONIFERÆ.—Abies Albertii, 2-yr., 6 to 8 inches, 4s. per 100; A. THE

Gardeners' Chronicle.

SATURDAY, JANUARY 21, 1893.

GARDENS, GRAVE AND GAY.

UNDER this fanciful designation, the Fine Art Society has opened a small but select exhibition of seventy water-colour drawings, by Mr. George S. Elgood, R.I. The interest and permanent value of the catalogue of this exhibition are very considerably enhanced by the excellent prefatory note—which runs into eight pages—from the pen of Mr. Reginald Blomfield. Mr. Elgood has succeeded equally well in his portrayal of the formal and of the natural styles of gardening in this country, although his love for extreme brightness has had the effect of rendering some of his purely floral pictures crude and unnatural.

The artist has been happy in his choice of the examples to illustrate the formal garden in England, for both those at Levens and at Melbourne are highly characteristic of an effete fashion. Each is, however, exceedingly interesting, the architect of the former, which is in some respects Dutch, being a Frenchman, M. Beaumont; whilst the latter was laid out in a purely French design by Henry Wise during the first decade of the last century. Concerning the latter, the prefatory note to the catalogue in question states, "Long alleys with palisades of Limes were formed, and an amphitheatre of Limes, with vistas radiating in all directions from a superb lead urn in the centre. The ground is of irregular plan, but the difficulties are met by the design in a most masterly manner. With the exception of some alterations made about fifty years ago, the original design is substantially perfect, and is a very valuable instance of a garden laid out when the French influence was still dominant in England." Of Levens, of which illustrations have appeared in the *Gardeners' Chronicle*, Mr. Elgood gives us charming little views, first of the formal garden itself with its trained Yews, and full of the work of the topiarist. "A garden place I found well-flowered"; of the dial—one of the best bits of the show and of the Yew arch. The Melbourne pictures deal first with an autumnal view, in which the artist's passion for contrast in colouring is perhaps a trifle too pronounced, the yellows and browns of autumn and the dark green hue of the Yew predominating; and secondly with the "Dark Arbour." Both these examples of the formal garden are essentially characteristic of the eighteenth century, "so strong in intellect, so utterly barren in imagination." Although the formal garden is perhaps dead, beyond the possibility of survival, it undoubtedly presented many features which were not antagonistic

either to good taste or to artistic effect. Its abominations were its clipped Yews and its mazes—features which to the majority of cockney tastes are still the most complete embodiment of high-class gardening. The modern revolt against the formal garden, which was not English, but of Dutch, French, and Italian origin, has, to a great extent, succeeded in sweeping away many features that might well harmonise with the natural style which is now so prevalent, and so much more in accord with English tastes than any of the rule-of-thumb introductions from the Continent.

In spite of the great popularity during the last century of the formal garden, with its trained Yews from Holland, and its statuary from Italy, the old English garden was never quite "snuffed" out, although it more or less suffered from the craze that prevailed for two centuries. Condover, Losely, Arley, and Penshurst are given as illustrations of the old gardens which are essentially English—formal without being artificial. Mr. Elgood's picture of "The Garden House, Arley," is quite idyllic in its exuberant beauty, with the rustic wooden-house covered by a wealth of Virginian Creeper and other climbing plants, of the old-fashioned border gay with the flowers such as Shakespeare loved, and of which our greatest poets have sung. "The Vicar's Garden," too, if a trifle crowded on the canvas with tall gaudy flowering-plants, is just one's ideal of what a vicar's garden should be, and the same may be said of "A Cottage Garden." Mr. Elgood is, as a rule, very successful in his floral portraiture, his "Stocks," "Purple Iris," "Pæonies," and "'The pale Sweet-William ringed with pink and white,'" being remarkably good. But the picture of the "Shirley Poppies" does not accurately represent the negligent kind of beauty which is a peculiar characteristic of these Poppies.

All interested in gardens, ancient and modern, would be well repaid by a visit to the Galleries at 148, New Bond Street, for among Mr. Elgood's exhibition of "Gardens, Grave and Gay," there are many charming views of the Riviera, the Italian Lakes, Verona, Genoa, and Nîmes in Provence, in nearly all of which the floral element is conspicuous and good.

"A View in the Garden at Speke Hall," with the timbered house showing in the background, exhibits some good uses to which the Irish Yew may be put in conjunction with herbaceous borders, the time of year being late summer.

"In a Quiet Hour" we have a tall Yew hedge fashioned like a folding screen, to shelter a zig-zag constructed seat. The idea is not bad; standing alone, as it does, it seems to need a link as it were to some group of trees or shrubs or substantial building.

"Azaleas, Birstall," is a gay delineation of Ghent and Mollis Azaleas, Pontic and other Rhododendrons. With few exceptions, the colours of the blooms are pale.

A curious effect is produced in "The Villa Giulia, Palermo," by the ancient wind-worn, clipped avenue of Cypress, with an incongruous narrow border edged with Box at their foot.

We wonder how our garden designers would like the big red washing-basin-looking plant-pots which contain the Orange trees in the Giardino Giusti, Verona. The Box hedges that go so well with an ancient garden and the slender Cypress, are quite as characteristic of Italy as the washing-basin pots. Grand masses of Opuntias, on the Arbutus Ridge, Mentone, are well delineated, as also the curious effect of contrast of a Peach tree in blossom standing against a background of dark Pine, possibly P. pinea.

The "Lesser Cloister, Certosa," shows excellent use of broad high Box edging, Lilium candidum, Begonias, and Pelargoniums in clumps.

NEW OR NOTEWORTHY PLANTS.

KNIPHOFIA TUCKII, *Hort. Leichtlin.**

THIS new Knophofia has been introduced into cultivation by Herr Max Leichtlin, who has done so much to improve our stock of the garden forms of this genus, of which upwards of forty distinct species are now known, against six only half a century ago. For many years he has been trying to re-introduce K. pumila (Tritoma pumila, Gawler, in *Bot. Mag.*, t. 764). At his instigation, Mr. Tuck recently undertook an expedition to the province of Colesberg, where T. pumila was last gathered by the late Dr. John Shaw. He brought home the present plant, which, although nearly allied to K. pumila (of which we have at Kew fine specimens collected by Burchell), differs from it by its shorter, broader, green leaves, perianth-tube widening gradually from the base to the throat, and less exserted stamens. Practically, it will answer every horticultural purpose which K. pumila fulfilled, as it possesses the same dwarf habit and the same dense raceme of bright red-yellow flowers.

Leaves ensiform, bright green, 1 to 1½ foot long, tapering gradually to the apex, ½ to 1 inch broad, low down, flat, with a prominent keel, distinctly serrated and scabrous on the edge. Pedunc'e moderately stout, shorter than the leaves. Raceme very dense, oblong-cylindrical, 5 to 6 inches long, 1½ inch diameter; flowers deflexed, yellow, at first tinged with red; pedicels very bright short, bracts oblong-lanceolate, scariose, ⅓ inch long. Perianth subcylindrical, ⅝ inch long; tube ⅛ inch diameter at the base, ⅛ inch diameter at the throat, widening gradually from the base to the throat; lobes ovate or oblong, obtuse, ⅙ inch long; stamens and style finally protruded, ⅜ to ⅙ inch beyond the tip of the lobes. *J. G. Baker.*

BEGONIA GLORY OF LORRAINE.

This new variety, figured in the January number of the *Moniteur d'Horticulture*, is the result of a cross effected by M. Lemoine between B. socotrana and B. Dregei. The seeds were sown in March, and the plants flowered in November of the same year. The habit is dwarf and bushy, the leaves more or less lobed, and the flower-panicles profuse. The individual flowers measure 1½ inch, and are of a delicate pink colour, and remain for a long time in good condition. Warm greenhouse treatment is required during the winter. In May or June the plants are placed in the open air, with due precautions, and returned to the greenhouse in the autumn.

A TRAVELLER'S NOTES.

(*Continued from vol. xii., p. 773*)

Batavia, February 6, 1892.—I arrived at Batavia at 10 A.M. on January 29, and left it again by the same vessel on February 6, in the meantime having spent the most interesting eight days I remember since leaving home. The island is very beautiful, and most interesting. One is struck even on the first day with the difference between the Dutch and the English in their colonies. What would be most *infra dig.* in India is done commonly in Java, as one instance, the ladies—all of them—dress as natives.

Buitenzorg.—On January 30 I went up to Buitenzorg, a journey lasting some two hours. Buitenzorg is some 900 feet above sea-level, and is much resorted to by people living in Batavia, some even living there, and going to and fro every day. The hills are not high, but prettily situated; not forming a continuous range more or less of the same elevation as in Ceylon, but low ranges and separate groups.

Tea is cultivated, and the quantity of Rice is extraordinary. Splendidly irrigated, there are miles on miles of it, not only as far as Buitenzorg, but right up to Garvet. The Javanese get three crops in two years, always from the same land. The Cingalese get more, but it is considered the above does not impoverish the land, as may occur in Ceylon. In the island twenty-three kinds of Rice are cultivated, one, I noticed, with black seeds. When young they rather differ in leaf, and I first thought I saw a different grain, but a German I met with, who has been twenty-five years here, tells me Rice only is cultivated. The Rice is sown in beds under water, and comes up very thick. In six weeks from the time of sowing it is pulled up by hand, and pricked out in the vast fields about 6 inches apart. The labour of hand-planting, or, rather, sticking the root downwards in the mud, for it is nothing else, speaks well for the industry of the Javanese.

Bread and Jack fruits are fairly common; Cocoa-nut and Areca Palms are very abundant. Musas and Bamboos, a fine strong variety, are also plentiful. The uses to which the stems of the latter are put to are innumerable. Houses and fences are composed of it; it serves as spouts to water-cans, to hold drinking water, and a smaller stem as a tumbler to drink out of; their bridges are composed of it from the supports to the floors; it is used in their hand-carts, it is eaten in curry, they fish with it, and put it to many other uses.

The vegetation along the railway line is rich. Lantana grows as a thick hedge, as freely as in Ceylon, but the Palms are nothing like so rich, nor do I think is the general vegetation. We passed over a good many waterfalls, sometimes hundreds of feet below us, and now pretty full, as it is the rainy season. It is hot, thermometer ranging from 80° to 86°. The early morning and evening, in each case then for about an hour, is the only pleasant time.

Coffee and salt are government monopolies. This appeared to me strange, but it is explained in this way: all rich virgin land the government acquires, and as it does not pay to plant on poor soil; a very considerable revenue is acquired in this way. A good deal of Tea is planted, though I saw but two big plantations, and met the owner of one. He told me that during a drought last year, which lasted seven months without a drop of rain, he lost 1,000,000 plants. John Chinaman is represented in Java, but not to such an extent as at Penang and Singapore; the Dutch do not encourage them—perhaps they are wise—it is certain in some things they have ousted the English in Penang, being content with smaller profits; more particularly is this the case with spices.

Buitenzorg Botanic Garden.

The Botanic Department in Java has three places—a mountain garden, some 50 acres in extent; an agricultural garden, about 2½ miles out of Buitenzorg, some 200 acres in extent; and the scientific garden at Buitenzorg, 90 acres in extent. The last is severely scientific and very thorough. It is laid out in plots on undulating grounds on the banks of a small river; the plots are irregular in shape and size, and divided by small paths of small round stones—owing to the heavy rain, no other kind of path could stand. These stones are stuck into the earth on end, and though they answer the wished-for end, are not pleasant to walk upon.

In the corner on each of these plots, and facing the paths, are wooden posts about 4 feet high, painted white. On these in plain black letters are the names of the order or orders represented in that particular quarter. Of each genus, each species is represented by two specimens, one of which has a good large white label with its name clearly painted thereon in black, whilst both have leaden labels nailed to their trunks, should the wooden one be lost. On the leaden label is a number corresponding to a numbered catalogue.

The garden has existed seventy-five years, and was arranged in the above-described manner fifty years ago, thus nearly every specimen is a tree, and as one turns from plot to plot, and from order to order, one looks through a small forest of trunks. If a specimen of foliage is required for comparison, a man has to go up the tree and get it.

The house of the Governor-General of Java is in the garden, and there are some pretty points round it: in front is a large pond, with two arms, one filled with Victoria regia in flower, with many dozen fine leaves, some developed, some in their prime, and some decaying, all touching each other, as one sees in pictures from South America. I have never seen it so fine as on this pond.

The other arm is filled with a white Nelumbium, flowering freely, its large flowers, pointed buds, and flat-headed seed-receptacles, standing on a stalk sometimes 3 feet out of the water; its foliage

* *Kniphofia Tuckii*, Hort. Leichtlin.—Foliis ensiformibus acuminatis viridibus pedalibus vel sesquipedalibus margine scabris serrulatis; pedunculo foliis breviori; racemo densissimo oblongo cylindrico; pedicellis brevissimis; bracteis magnis scariosis oblongo-lanceolatis; floribus deflexis rubro-luteis; perianthio 7—8 lin. longo, tubo e basi ad oram sensim ampliato; genitalibus exsertis.

is very thick, and forms a splendid mass. In the centre of this pond is an island with bushes of Duranta Ellisii, their long bunches of golden yellow seeds hanging thick to the water's edge, a lovely sight; as well as some fine Acalyphas and tall Cyrtostachys Renda, with its pretty scarlet leaf-sheaths.

From the Governor's house to the entrance, runs a fine avenue of Canarium commune, forming a lovely tunnel some 80 feet high. The stems of these Canariums are covered with creepers in the wildest profusion; some parts of some of the stems are quite hidden. Pothus aurea, with a stem sometimes 2½ inches in diameter, clings with extraordinary tenacity, ascending and encircling the trunk in a corkscrew-fashion, its fine, highly-coloured leaves hanging down on all sides; Philodendrons and Anthuriums grow with equal freedom, their rich glossy foliage producing a fine effect. Hoyas are creeping up some, but were not in flower; Asplenium nidus was most common in this avenue, high up in the forks of the branches and encircling the main stem itself. Near this avenue are Dr. Treub's house, offices, laboratory, nursery, and gas-engine.

Another small avenue of Oreodoxa regia leads from the Governor's house to the main road of Buitenzorg. These trees are yet young; there are finer specimens of this Palm in the garden. Behind this are some magnificent Bamboos, 50 to 60 feet high, and many yards in diameter, gracefully drooping over; and a fine avenue of Livistona, chiefly rotundifolia and ovalifolia, many of the stems not less than 90 feet high. It produces a very curious effect, these long straight stems with the small tuft of leaves on the top. This avenue is one of the finest sights in the garden. On one side, the stems, all of them, to about 12 feet from the ground, are covered with the purple-flowering Ipomœa, blooming freely. This avenue leads from an entrance in the main road past that portion of the grounds set aside for the collection of Rattans, on to the nursery, offices, &c. On one side of it are young Palms, species lately received, and there planted, as the original Palmetum is now full.

On the other side in the centre of a large grass plot, relieved by an edging of purple-leaved Oxalis, is a plain small red stone obelisk, on the base of which in gold letters are suitable words stating it to have been erected to Johannes Elias Teysmann. Round the oblong grass plot is a narrow path and beds filled with China Roses in good condition, whilst at one end is a thick impregnable bank of Bamboos.

The collection of Rattans is most interesting. Care is necessary in walking through as the young shoots armed with their short rows of strong sharp thorns, half circular in shape, hang down in all directions. The main stems twist and curl over themselves and over each other, like long snakes all over the ground, and often up the stems of the tall Cedrelas, which shade them. Tall Oreodoxas, O. oleracea in particular, with the stem not less than 90 feet high, like the barrel of a great cannon, and almost as straight and smooth as a lead-pencil, as well as many Arecas, Cocos, and other Palms edge this interesting Rattan enclosure. One of the Cocos, C. oleracea, with leaves strong and stiff, from 25 to 30 feet long was a fine sight. With one or two other Palms near the Governor's house, and an avenue, a short one, but still a veritable tunnel of the same strong-growing Bamboo, the ornamental portion of the garden may said to have been exhausted, and I will now give some little idea of the main portion.

Before entering by the chief entrance is a fine Amherstia, some 40 feet high, a very good specimen, not now in flower, but its long young brown leaves render it still very pretty. Near this on the stem of a Canarium commune, some 4 feet from the ground, is a fine Grammatophyllum speciosum, with forty-six spikes of flower, some with twenty-four open flowers and many more buds to follow; the piece is about 15 feet through, some of its stems being 9 feet long—it was a splendid sight.

On entering the gardens, by far the major portion lies on one's right. The first order one comes to is the Leguminosæ, with some fine trees. Though not now in flower, its Bauhinias, Amherstias, Browneas, and Poincianas, must make a fine show in their season.

Descending a short hill, one soon espies all kinds of Pandanus, their tall, crooked, naked stems, with short tufts of stiff leaves on the top, being sometimes 30 to 40 feet high. This order—Pandaneæ—is certainly a remarkable one to look at. Opposite these is the collection of Cycads—not large, but wonderfully even specimens; whilst on the other side of the path are the Orchids, which Dr. Treub says do not do well. They are nearly all attached to the stems of living Plumieria acuminata, mentioned in my former letters as producing a flower sacred in India. Probably the best amongst these Orchids are Bulbophyllums, some Dendrobiums, and

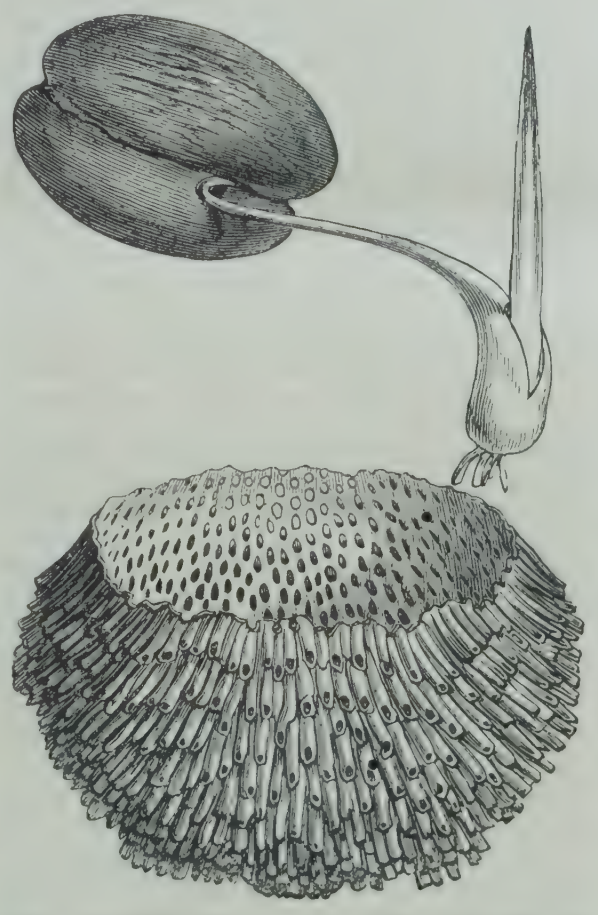

FIG. 12.—GERMINATION OF THE DOUBLE COCOA-NUT AND CUP-LIKE BASE OF THE FULL GROWN STEM (BOTH GREATLY REDUCED).

certainly the Cœlogynes. Erias are good, but Saccolabiums and East Indian Orchids are weak.

The Palmetum is next reached. Dr. Treub tells me, next to Kew, he believes Buitenzorg has a greater number of Palm species than any other botanical garden in the world, and here are

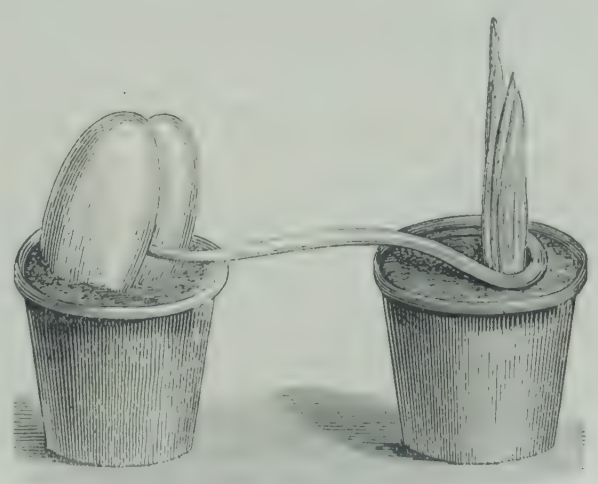

FIG. 13.—GERMINATION OF THE DOUBLE COCOA-NUT AT KEW (MUCH REDUCED).

some fine plants—wonderfully handsome specimens. Amongst the most noticeable is a noble tree of Corypha australis with a stem 3 feet through, and some 35 feet high, with a fine head of its immense palmate leaves. Cyrtostachys Renda is finer here than I have yet seen it—35 feet high—with wonderfully straight stems, and heads of stiff leaves, like Areca lutescens, but the leaves are shorter and stiffer; its red leaf-sheaths are very striking from a distance.

There are also, on the slope towards the river, some fine Attaleas—particularly one, an A. macrocirna (?), with a stem some 36 inches in diameter. Its leaves are between 20 and 25 feet long, forming a splendid spreading head; in their axils are the thick bunches of seed, each as large as an ordinary-sized Plum. Phœnix sylvestris is remarkably pretty; its spreading canopy of leaves is regular and thick, the lower one gracefully drooping over. There were some about with tall stems, varying in height.

Amongst the Oncospermas were some fine specimens, their numerous stems rising from a common base to a great height, with good heads of leaves, some ascend as much as 80 feet; their foliage is both fine and graceful. Caryotas, Phœnix, Borassus, Oreodoxas, and Arecas, many with their bunches of drooping red seeds, are well represented, as well as the various kinds of Cocos, one of the finest of which is another C. oleracea, with a stem 2½ feet in diameter, and a splendid head of thick leaves. Dr. Treub has a fine Lodoicea seychellarum, not so big as Dr. Trimen's, but nearly so; its leaves are 10 feet broad, magnificent, and very hard; when the stalks are tapped with a walking-stick, it is like tapping iron. Metroxylon elatum is a curious Palm; its strong, stiff stalks have circular, always slightly ascending lines of brown hairs; added to this peculiarity, it is a pretty Palm in itself.

Near the Palmetum is another very interesting order—the Coniferæ. Araucarias are well represented; A. excelsa will not thrive here, but Bidwilli and Rulei, some 20 feet high, are good amongst others. Small Cupressus Knightii, and some larger C. Goveniana and funebris, nearly 30 feet high, are pretty. Junipers and Dacrydium elatum also do well. There is also a handsome Podocarpus, P. polystachyus, with leaves 8 inches long, in the way of our P. macrophyllus, but stronger. Two of the finest trees in the Coniferæ are Pinus macrophylla and Dammara alba; both splendid trees, some 60 feet high. Dr. Treub is particularly proud of the latter; it certainly is wonderfully even and handsome.

The fernery under thick shade is a wonderfully pretty place; tall Tree Ferns, with their long, graceful fronds, as well as the dwarfer Nephrolepis, Onychiums, Scolopendriums, Nephrodiums, Microlepias, and others, are doing well.

There are but few flowering plants to be seen in the whole place; an exception to this are the Pavettas (Rubiaceæ). There is a large collection of these, many bearing their Ixora-like heads of bloom.

Beyond the palmetum, Dr. Treub pointed out a large semicircular piece of ground on the river bank, full of only rough stones and boulders, with a little coarse grass, and a bed of Cereus, Opuntias, &c. He told me during a very heavy rain-storm the river had overflowed, and so sudden and great was the rush of water, that the side of the slope was washed clean off. Nothing but these Mexican plants will now grow there.

The collection of Figs (some with fine stems) is very large, and the Euphorbiaceæ is an extensive order, well represented. Probably some of the finest trees are in the tropical order Dipterocarpeæ; but, as I have said, being all more or less fifty years old, you can well imagine there are some fine trunks to be seen. Of the heads one seldom gets a clear view, as all are planted in the quarter amongst many others belonging to their order.

The herbarium of tropical plants is most complete, and in course of revision, a most arduous task. Owing to the dampness of the climate, all dried specimens are enclosed in tin cases opening outwards and painted black. Beneath this, on the ground floor, is a museum of economic products, all carefully arranged and labelled in glass cases. One contains all kinds of fibres, others seeds, gums, rattans, oils, guttaperchas, and barks. This museum is a very interesting place.

Outside this is a laboratory at the disposal of the analyst. Here, arranged in glass bottles, are plants, and the various parts of plants, all reduced to powder, ready for experiment.

The library contains many fine works, and receives the scientific journals of every society of note in Europe. From time to time Dr. Treub also purchases rare and valuable works. The gardens publish three journals, one a practical one in Dutch, and one scientific, in which the articles must be in French, German, or English—Dutch is excluded. Dr. Treub tells me all plants, with the exception of ornamental ones, are given away free to applicants; but ornamental ones are only given in exchange—no

money is ever taken for anything from anybody. The temperature at Buitenzorg varies all the year round from 73° to 86° F., and the rainfall is between 4 to 4½ mètres. The offices are fairly extensive. In the office work Dr. Treub has two Europeans to assist him, his post being from twenty to thirty letters a day.

But the most interesting thing in Buitenzorg is the system and the thoroughness of the whole concern. The staff Dr. Treub has at his disposal includes twelve Europeans—all (with the exception of one, German) Dutch, and five of whom are doctors of science. These thirteen in all have six departments—scientific and practical. At the disposal of the scientific portion is a large well-fitted-up laboratory. All instruments, &c., necessary to pathology, physiology or bacteriology are here, and a gasometer filled with gas made from petroleum, has been recently erected. This gas is not used for lighting purposes, but for creating excessively high temperatures and other scientific purposes. There is also a fine dark room, and another close by with a large camera for scientific and photographic purposes. In the large laboratory are five tables at the disposal of any Dutchman or foreigner desirous of following a course of study at Buitenzorg. There are usually three or four availing themselves of this privilege—now there are five, including an Oxonian. Germans are those who usually come, often with a grant from some scientific society. Holland gives a biennial grant for one man, and at the present time there is a professor here with a grant from an Austrian society. The usual method is to have six months—a month for the journey each way, and four months to work at Buitenzorg. All is free—tables, instruments, an extensive library—in fact, everything. *James H. Veitch.*

(To be continued.)

A SYNOPSIS OF THE SPECIES OF CANNA.

(Continued from p. 43.)

4. C. COCCINEA, Miller, *Gard. Dict.*, edit. viii. (1768), No. 3; Rosc., *Scit.*, t. ii. *C. rubra*, Willd. Stem slender, green, 4 to 6 feet long. Leaves oblong, acute, longer than those of *C. indica*. Inflorescence a lax simple raceme; bracts small, green, orbicular. Sepals lanceolate, tinged with red, ⅓ to ½ inch long. Petals lanceolate, tinged with red, 1½ inches long. Upper staminodia three, oblanceolate, often distinctly emarginate, 2 inches long, under ¼ inch broad; lip red-yellow, distinctly emarginate. Capsule globose, small.

Var. C. SYLVESTRIS, Rosc., *Scit.*, t. 10. Upper staminodia longer, with a long claw like the emarginate lip, plain deep crimson.

Hab.—Widely spread in tropical America. Here apparently belong *C. cinnabarina*, *fulgida*, *formosa*, *portoricensis*, and *surinamensis*, of Bouché. We have at Kew an excellent unpublished drawing of *C. sylvestris* made by J. Curtis in 1819. *J. G. Baker.*

5. C. LATIFOLIA, Miller, *Gard. Dict.*, edit. viii. (1768), No. 2; Rosc., *Scit.*, t. 4. *C. gigantea*, DC., in *Red Lil.*, t. 331; *Bot. Mag.*, t. 2316; *Bot. Reg.*, t. 206. *C. macrophylla*, Bouché. Stem stout, pubescent, reaching a length of 12 to 16 feet. Leaves oblong, acute, green, the lower ones reaching a length of 3 to 4 feet. Inflorescence a panicle formed of several lax racemes; final bracts oblong, green, ½ inch long; lower branch-bracts brown, scariose, reaching a length of 6 to 8 inches. Sepals oblong, green, ½ inch long. Petals lanceolate, tinged with red, 2 inches long. Upper staminodia three, oblanceolate, bright red, 2½ to 3 inches long, ¼ inch broad, entire or emarginate at the apex; lip plain bright red, distinctly emarginate. Capsule much larger than in *indica* and *orientalis*.

Hab.—Venezuela, *Moritz*, 1714! Andes of Bogota, alt. 8000 feet, *Triana!* Here, according to Horaninow, belong *C. neglecta*, Weinm. and *C. gemella*, Nees.

6. C. HELICONIÆFOLIA, Bouché, in Linn., viii., 164. Stem 6 to 8 feet long. Leaves oblong, resembling those of *Heliconia Bihai*, thin, papery, green, the lower 2 to 3 feet long, above 1 foot broad. Inflorescence a panicle of several lax racemes. Sepals lanceolate, above ½ inch long. Petals lanceolate, coloured, ½ inch long. Upper staminodia three, oblanceolate, scarlet, not much longer than the petals; lip the same colour. Capsule large, ellipsoid.

Hab.—Mexico, valley of Cordova, *Bourgeau*, 1871. I have no material for separating *C. xalapensis*, Bouché.

7. C. PEDUNCULATA, Sims. in *Bot. Mag.* t. 2323; Rosc. *Scit.*, t. 8. *C. Buckii*, Weinm; *C. reflexa*, Nees. Stem slender, green, glaucous, glabrous, 5 to 6 feet long. Leaves oblong-lanceolate, green, glaucous, the lower 1½ to 2 feet long, 3 to 4 inches broad at the middle. Inflorescence a many-flowered lax raceme, with a hairy rachis, and long erecto-patent pedicels to each flower; bracts small, oblong, obtuse. Sepals oblong, small, green. Petals lanceolate, green, reflexing, 1 inch long. Upper staminodia three, oblanceolate, pale yellow, emarginate, 1 to 1¼ inch long. Lip oblanceolate, plain yellow, emarginate. Capsule small, globose.

Hab.—South Brazil, *Glaziou* 898! Very distinct, but not worth cultivating either for its leaves or its flowers.

8. C. LAMBERTI, Lindl., in *Bot. Reg.*, t. 470 (excl. syn.), Rosc. *Scit.*, t. 2.—Stem stout, green, glabrous, reaching a length of 12 to 14 feet. Leaves oblong, green, acute, the lower 1½ foot long. Inflorescence a lax few-flowered simple or forked raceme. Bracts large, oblong, green. Sepals lanceolate, pale green, ½ inch long. Petals lanceolate, 2 inches long, much tinged with red. Upper staminodia three, oblanceolate, bright crimson, entire, scarcely longer than the petals, ½ to ¾ inch broad. Lip plain, bright crimson, entire. Capsule oblong, 1½ inch long.

Hab.—Introduced into cultivation from Trinidad in 1820 by Mr. A. B. Lambert. Dominica, *Imray*, 423! Represented in the gardens of to-day by the form called *Revoil Massot*. I have no material for separating *C. Poeppigii*, Bouché, a native of the Upper Amazon region.

9. C. EDULIS, Ker, in *Bot. Mag.*, t. 2498; *Bot. Reg.*, t. 775; Rosc., *Scit.*, t. 5; Bentley and Trimen, *Med. Plants*, t. 266. *C. esculenta*, Lodd. Rootstock large, tuberous, edible. Stem stout, purple, reaching a length of 8 to 12 feet. Leaves oblong, green, or bronzed, the lower 1½ to 2 feet long. Inflorescence a lax simple or forked raceme; flowers usually in pairs; bracts oblong or orbicular. Sepals oblong-lanceolate, tinged with red, ½ inch long. Petals lanceolate, 1½ to 2 inches long. Upper staminodia three, oblanceolate, plain bright red (rarely orange-yellow), entire or emarginate, 2½ inches long, ⅓ to ½ inch broad; lip bright red or red-yellow, emarginate. Capsule much larger than in *C. indica*.

Hab.—Tropical America. Our Kew specimens are from Peru, South Brazil, and Uruguay, but its native area is quite uncertain. From its rootstock is procured the Canna starch, or *Tous les mois*, and it is grown in the Paris parks for the sake of its foliage. I have seen cultivated specimens from Madeira and the Friendly Islands, but not from St. Kitts, or any of the West Indies. Lambert raised it from seeds that were taken from a herbarium specimen of Pavon, which was thirty years old. It is called Achiras in Peru.

10. C. FINTELMANNI, Bouché, in *Linn.*, xviii., 487; K. Koch, Allg. *Gartenzeit.*, 1858, 358, with coloured figure. Stem green, glaucous, 4 to 5 feet long. Leaves oblong, acute, green, glaucous; the lower a foot long. Inflorescence, a lax, few-flowered, simple raceme; bracts green, oblong. Sepals oblong, green, ⅓ inch long. Petals lanceolate, pale green, 1½ inch long. Upper staminodia three, oblanceolate, obtuse, entire, plain bright yellow, 2½ to 3 inches long, ½ inch broad; lip oblanceolate, entire, yellow mottled with red. Capsules larger than in *C. indica*.

Hab.—Probably Tropical America, if it is not a garden hybrid between *glauca* and *indica*. *C. Schlechtendahliana*, Bouché, placed next to this, has the upper staminodia spotted with red. The form called *Guillaume Coustouy*, figured in the *Gartenflora*, t. 1203, matches the description.

11. C. GLAUCA, Linn., [*Sp. Plant.*, 1 (excl. syn.); Smith, *Exot. Bot.*, t. 102; Rosc., *Scit.*, t. 7. Stem green, glaucous, reaching a length of 5 to 6 feet. Leaves green, glaucous, oblong-lanceolate, very acute, the lower 1½ foot long, about 4 inches broad at the middle, tapering gradually to the base. Racemes lax, simple or forked. Sepals lanceolate, green, ½ inch long. Petals lanceolate, yellowish-green, 1½ to 2 inches long. Upper staminodia three, pale yellow, unspotted, entire, 2½ to 3 inches long, ½ to ¾ inch broad; lip linear, pale yellow, emarginate. Capsule oblong, 1½ to 2 inches long.

Hab.—Throughout Tropical America, from Mexico and the West Indies to Peru and La Plata. It is the Albara of Piso's book on the *Economic Plants of Brazil*, published in 1648, and *C. angustifolia*, Linn. as regards the plant of Morison, from which the specific name is taken. Here also belong *C. stolonifera*, *mexicana*, and *longifolia* of Bouché. Linnæus confused it with *C. flaccida*, Salisb., which belongs to another subgenus. *J. G. Baker.*

(To be continued.)

THE ROSERY.

GOOD ROSES FOR THE GENERAL CULTIVATOR.

THE number of Roses that are at the present time catalogued bewilder many a would-be purchaser selecting his varieties for a good collection, for after having read a catalogue over and over again, he at last makes up his mind as to those he will purchase, but do they turn out to his expectation, and give entire satisfaction? Some may, others will not do. Much of this disappointment with purchases could be remedied by informing the nurseryman the situation of the garden, the nature of the soil, and if the Roses are for outside, or for the greenhouse, or Rose-house. The same advice applies to the purchase of Roses for forcing, on which subject I may at a future time have a few remarks to make. The following list of varieties are, I think, still worthy of a place in most gardens; and, although they are old, may be depended on to give good results. Twenty-four hybrid perpetuals suitable for standards or bushes: — Alfred Colomb, bright carmine-red; Baroness Rothschild, very light rosy-pink; Beauty of Waltham, bright rosy-crimson; Boule de Neige, purest white; Charles Lefebvre, fine bright red, shaded; Dr. Andry, bright red, shaded crimson; Duchesse de Morny, clear light rose; Duke of Edinburgh, rich vermilion; Duke of Teck, very light crimson-scarlet; Dupuy Jamain, bright cherry-rose; Earl Dufferin, rich velvety-crimson; General Jacqueminot, brilliant velvety-red; John Hopper, fine rosy-crimson; La France, silvery-peach; Madame Gabrielle Luizet, light silvery-pink; Madame Lacharme, pure white; Madame Victor Verdier, vivid carmine; Magna Charta, bright pink; Marie Baumann, light crimson-red; Marquise de Castellaine, pure rose; Merveille de Lyon, white, slightly tinted; Monsieur Boncenne, blackish-crimson; Prince Camille de Rohan, very dark crimson-maroon; Sénateur Vaisse, showy-red.

Six best varieties for walls, with south, south-eastern, or south-western aspects:—Gloire de Dijon, Tea, yellow, shaded salmon; Reine Marie Henriette, H.T., deep carmine; Cheshunt Hybrid, H.T., cherry-carmine; W. Allen Richardson, Noisette, orange-yellow, beautiful in bud; Celine Forestier, Noisette, rich sulphur-yellow, requires light pruning; Maréchal Niel, Tea, golden-yellow, but best indoors. And a few of the hardier Teas for dwarfs and standards:—Gloire de Dijon, Tea, yellow, shaded salmon; Grace Darling, H.T., white, shaded rose—good; Francesca Kruger, Tea, copper, shaded yellow and rose; Madame Lambard, Tea, bright rose; Niphetos, Tea, pure white; Marie Van Houtte, Tea, yellowish-white—edge of petals rose.

Six climbing Roses, suitable for covering old trees, arches, &c., all being rapid growers:—Alice Gray, Ayrshire, white, edged pink; Félicité-Perpétue, evergreen, creamy-white—beautiful; Polyantha simplex, single immense bunches of white flowers; Polyantha grandiflora, single white large flowers, 3 inches across; The Garland (hybrid Musk), nankeen and pink—large bunches; Splendens, Myrrh-scented, white, edged with red. *W. T. C., Kingston Hill.*

PHALÆNOPSIS CULTURE.

This genus of Orchids is seldom taken in hand by small growers, probably owing to the prevailing belief that other than professional orchidists have no success with it, and it is for the encouragement of those who are not Orchid specialists, that I venture to write a few notes on the culture of these beautiful plants. There exist some grounds for the opinion generally held respecting the difficulty of managing Phalænopsis, and to keep them in good health even for only a few years, and one is, that few gardens have special means provided for the accommodation of the plants; still they may be grown with a fair amount of success in an ordinary plant stove with the other plants, by paying attention to their simple requirements. And as an illustration of this fact, I will jot down some particulars of their culture on a limited scale, that is, with twelve plants that are under my charge.

These plants were bought in the spring of 1887, when they were very small, and growing in pans, and although there is now nothing remarkable about them, they are nevertheless satisfactory, considering the circumstances under which they are grown. The best plants are P. amabilis, with eight healthy leaves, the largest being 13 inches long by 4 inches wide, and having at the present time a spike with fifteen flowers; P. Schilleriana, with six leaves, the largest of which is 15½ inches by 4¾ inches; and P. Stuartiana with eight leaves, the largest being 15¾ inches by 4 inches. These last two plants are now pushing strong flower-spikes, as are also most of the others. The smallest is a plant of P. violacea with five healthy leaves.

The house in which the plants are grown is half-span, with a walk along the back, and in the front a bed of ashes on which Palms, and other ornamental-foliage plants are arranged, while two shelves overhang the path, and are filled with Calanthes. A water-tank with an open dipping-space is placed beneath the end of the bed, and it is over this open part of the tank that the Phalænopsis are suspended at a distance from the glass of about 2½ feet, the remaining portion of the roof being occupied by plants of Nepenthes.

In February, 1888, the plants were taken from their pans, their roots washed well by means of the syringe, and then placed in baskets of Teak, which they still occupy. Pieces of charcoal, clean crocks, and sphagnum were the substances used as a rooting medium, and in February of each year the sphagnum, and such particles of crocks and charcoal not fixed to the roots, are carefully removed, and replaced with fresh, after the roots, &c., have been thoroughly cleaned with tepid water, and a top-dressing of sphagnum-moss is again afforded them in August. Although the most healthy roots are found where they are exposed to the light, and either clinging to, or hanging from the baskets, constant care is exercised to prevent the direct rays of the sun reaching them, and for this reason the first shade over them is a constant coating of "Summer Cloud," and it is moreover, covered with canvas when the sun shines. No point connected with the culture of these lovely plants is more important than that of shading, and any slight carelessness in attending to it may bring about the ruin of the plants. Watering is another matter of vital importance, and our plants are examined each morning, and twice in a day during very dry weather, when, if the sphagnum, &c., is found approaching dryness, the baskets are lifted down, and plunged in tepid rain-water. The foliage is never syringed, but atmospheric moisture, more or less, is always maintained in the house, and regulated according to the conditions of the weather, for indiscrimination in this respect would work much mischief, by causing spot, if the amount of moisture were excessive; and, on the other hand, injury will soon accrue from the contrary, the Phalænopsis, unlike many Orchids, having no pseudobulbs in which to store a reserve of sap—consequently, it readily suffers from the effects of evaporation. In order to counteract the possibility of injury arising from a sluggish moist atmosphere, a circulation of the air is brought about by means of small pipes placed at intervals along the apex of the roof at the back and front walls of the house, those in the last named, which abut on the flow ripe of the warming apparatus, being left constantly open, while the others are closed during the winter. Ordinary stove temperature is kept, that for the night in winter being 60°, except in severe weather, when it falls to 55°, the blinds at such times being run down to save fuel, and lessen the evil effects of much artificial heat.

The Phalænopsis sometimes becomes enfeebled if allowed to go on flowering unchecked in the free way that seems natural to the plants, and it is therefore advisable to rest any plants which appear to be exhausted from this cause, by rubbing off the flower-spikes as soon as they appear for a season. I have adopted this practice with much advantage to the plants, and have likewise observed the benefit derived through cutting off the spikes as soon as their blossoms have expanded, instead of leaving them for a time upon the plants. I cannot help thinking that very little, and what to some may appear insignificant, circumstances, have much to do with the welfare or otherwise of many plants, particularly those of a sensitive nature, such as the Phalænopsis. The fact of the plants described above being over a water-tank (which I may mention has no pipes in it), and which is placed at the north end of the house, and therefore is not reached by powerful sunshine at any time, has a great deal to do with their good condition. This belief was strengthened lately by the following remarks of an "old hand," distinguished for his knowledge of Orchids. "Oh! I have before noticed the Phalænopsis doing well in gardens where least expected, and *vice versâ*. What apparently trivial thing do you think you have to thank for the welfare of these plants?" The position was the answer. "Yes, just so, the tank." I cannot, however, accept the first remark as a compliment; although it was good-naturedly passed. I should have been more pleased if something good to be seen had been expected here. *Nemo.*

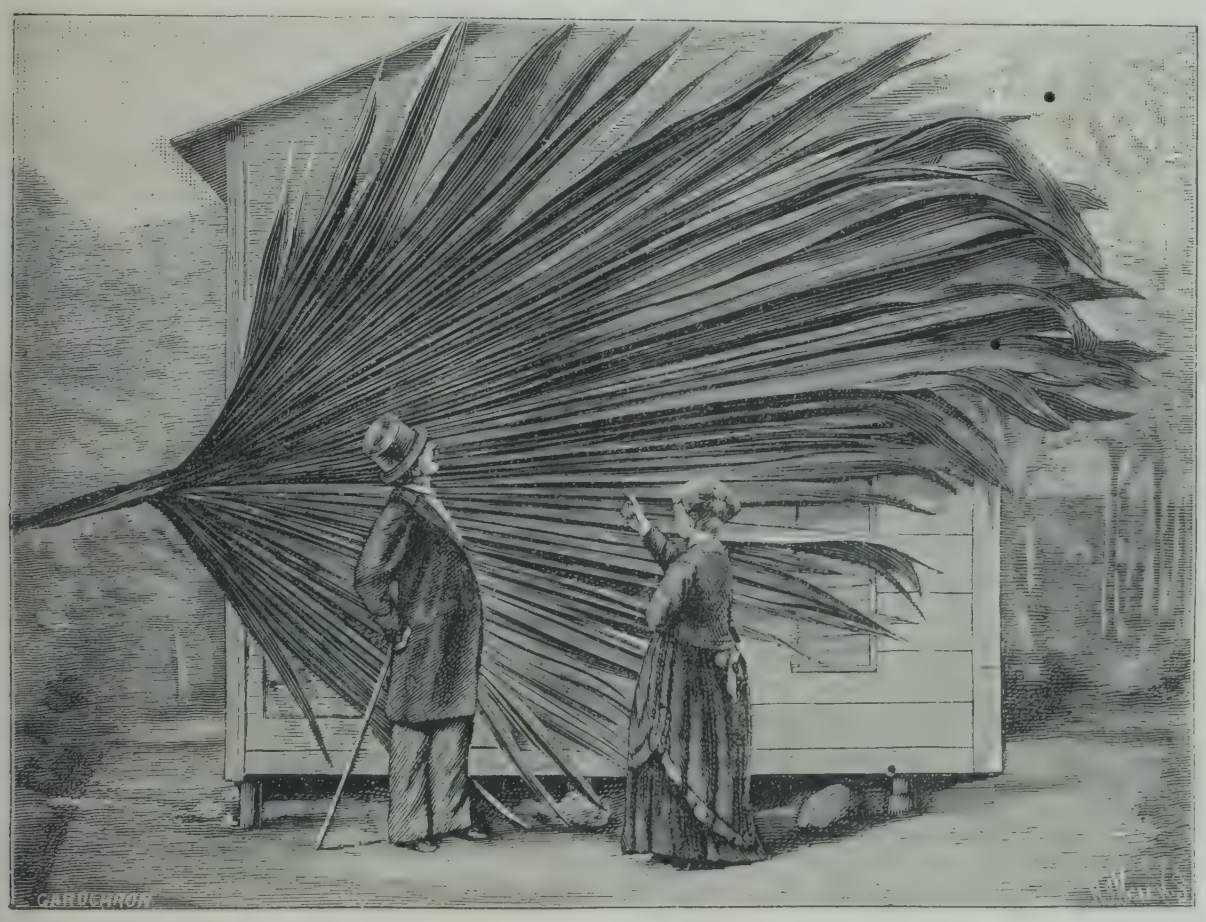

Fig. 14.—Leaf of the double cocoa-nut, illustrating its dimensions. (see p. 74.)

VEGETABLES.

LAXTON'S CHOU DE BEDFORD.

This new variety of Borecole, which is to be introduced this season by Mr. T. Laxton, Bedford, I have already tried, and I find it to be excellent, in fact, superior to other kinds of winter Greens which come into use at the same time. The seed was sown with those of ordinary winter Greens, and the plants grown under similar conditions. The plant grows vigorously in rich soil, and requires ample space to develop properly. It produces heads in the form of a large loose Cabbage, which, when properly cooked, are of delicious flavour, as are the footstalks of the outer leaves of the head. In my opinion in this respect it is unsurpassed by any other kindred subject of its class which comes into use at the same season, namely, during the autumn and early winter months. [Couve tronchuda? Ed.] So far as my experience goes with it, it appears hardy, and likely to produce sprouts later on; it will, I believe, be an indispensable subject in most gardens when it becomes known and tested. *G. T. Miles, Wycombe Abbey.*

THE APIARY.

WRAPPINGS.

Warmth is all-important to stock directly brood rearing is started by the bees, and any help that can be afforded them in keeping up the internal temperature of the hive in the breeding season will be a gain to the colony. For this purpose existing wrappings should be increased in thickness at an early date. Various materials are brought into requisition to serve for wraps, but anything composed wholly or in part of wool is the best.

Entrances.

Entrances to hives should be looked to, and kept clear of accumulated rubbish and dead bees. A piece of bent wire is the handiest thing to use for the purpose, and can be passed in without disturbing the colony. Skeps with their usually small entrances are more likely to get completely blocked than frame hives, and it is a real source of danger, as bees often get suffocated from this simple cause.

Candy Feeding.

Candy is the only permissible food at this season, and it is only those stocks that have been neglected that will require artificial feeding for some weeks to come. Should any stock be short, which can be

ascertained by turning back the quilt and examining the combs, or by feeling the weight of the hive, a 2-lb. cake of candy should be placed over the cluster.

INDOOR PREPARATIONS.

This is the time when all plans should be thought out, and decided on, for carrying out next season's work, and every article likely to be required got in readiness. It has been truly said that in beekeeping everything must be done at the proper time, and that to do otherwise is to give success away. If, therefore, appliances are not to hand, and cannot be procured at the moment they are required, when honey is coming in, it is impossible to act on this truism. A list should be made of such things as brood and super foundations, sections, frames, excluder zinc, &c., which should be ordered as soon as possible. When these come to hand, the work of fitting the foundation in frames and sections can be proceeded with, the latter being then put into the crates, two of which must be provided for each hive intended to be worked for comb honey.

EXCLUDER ZINC.

A prejudice appears to exist with many bee-keepers against the use of queen-excluding zinc. It seems to be the impression that it acts as an impediment to the working of the bees. Opinions having been expressed that they lose time in passing through the perforations, and that they must of necessity knock the pollen pellets off their legs. The best way to dispel these ideas is to place a piece of the zinc over the entrance of a populous hive, and watch the result. It will be found that after a short time the bees will pass in and out of the hive as expeditiously and safely as before. Having proved this much, it will be found to be a good plan to use excluder zinc in all hives, whether worked for comb or extracted honey. In the case of the former, in addition to keeping the queen below, it will be a distinct advantage to have the bottoms of the sections free from attachments to the tops of the frames, and will make it much easier to lift up the crate when it is required to remove it it, or to slip a super-clearer underneath. *Expert.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Pickering Lodge, Timperley.*

GENERAL REMARKS.—Work is not pressing at present; we are busy sponging and cleaning Cattleyas and Lælias, which I prefer to do rather than wait till the plants are in a more active state, there being now less danger of injuring the plants, as the pseudobulbs are matured, and the plants are resting. The cleaning of Orchids during growth is productive of much mischief to roots and new growths. I employ soapy-water only, and when cleaning a Cattleya plant, the sheaths embracing the pseudobulbs are not pulled off doing this, injuring and disfiguring the plant. When a plant is infested with white scale (Aspidiotus sps.), the pseudobulbs can be cleaned by a careful man without stripping off the sheath, using a soft brush and pointed wooden peg. If this species of scale insect be not well searched for at this season, it will greatly increase when the plants commence to grow. Having cleaned the plants, the pots should be washed, and the house put in good order. Cattleya Trianæ and C. Percivalliana will require a little more water now, which will be of assistance to them in opening their flowers.

THE MEXICAN-HOUSE will be made gay with the flowers of Lælia anceps, dark and white varieties. Lælia anceps Dawsoni still holds its own, with the exception of L. anceps Schroderiana, which, in my opinion, is the finest white-flowered Lælia. L. anceps Sanderiana is another good white form. Our white varieties are flowering more freely this season than previously, and I think we are either beginning to understand their needs, or they are getting acclimatised. Another fine Lælia is Gouldiana, which should be in every collection. The Mexican-house here makes a capital show-house at this season, and in it are grown Cœlogynes, Lælias, Cymbidiums, and Sobralias, with plenty of green foliage to set off the flowers. Any species of Orchid or stove plant can be placed in this house with safety, and we place Cattleyas, Calanthes, Odontoglossums—in fact, anything, as the house is kept rather dry, and will be so kept for some little time longer. The Cœlogynes must be watched, and not allowed to shrivel for want of water; their flower-spikes will now be so far advanced as to be almost out of danger from damp, and when they have arrived at this stage, a heavy watering will assist the plants to push up the flower-spikes. I prefer this house for showing off flowering plants rather than usual show-houses, which are, I think, very injurious to Orchids, for the simple reason that when there is a good show, gardeners are apt to forget the well-being of the plants, and allow the flowers to remain on them for too long a time. It is better to flower the plants in the house they are grown in, the flowers lasting quite as long, and it is better for the plants, unless it be in the summer months, when the show-house is kept moister.

THE FLOWER GARDEN.

By T. W. CRASP, *Gardener, Canford Manor, Wimborne.*

CHRYSANTHEMUMS AND CLIMBING PLANTS, &C.—All the required Chrysanthemum cuttings having been taken by this time, the stools should be put for a time into cold pits and frames, affording them air when it is not frosty, or in very mild parts of the country they may be turned out of their pots, and planted between shrubs and in the herbaceous border, and thus assist to brighten the garden in late autumn. It is not too early in some parts to sow clumps of Sweet Peas in the open ground in prepared trenches, sowing the seed about 4 or 5 inches below the surface of the ground. The Peas may be sown in clumps or lines, covering the surface with finely-sifted coal-ashes as a protection against frost, and to a certain extent against slugs; at the same time a sharp look-out must be kept on the latter when the plants begin to come up. These Peas will be in bloom at a very early date. There are many species of climbing plants, as Roses, Jasmines, Bignonia radicans, Clematis, and a host of others, which may now be planted for rendering beautiful the bare and unsightly places on walls and buildings. The old-established flowering-plants on walls, &c., should be looked over, and pruned, by taking out the useless and flowerless shoots, being careful not to prune such as produce their flowers on last season's growth before the blooming-period is over. After pruning and regulating, each plant should be made secure by fastening to the wall, &c., in such a manner as will best show off its beauty. Never use the shears, as some do, in pruning a flowering-plant, as this practice may render a plant neat-looking, but it will effectually spoil its flowering, unless it be a Jasminum officinale, or some of the Clematises which flower on the current year's wood. The early-flowering Clematis of the montana group, as C. patens, C. florida, and C. Sieboldi, flower on the long shoots of the previous season, and naturally these will be retained. Clematis lanuginosa and some of its varieties may, if trained to walls, be cut down to 3 feet from the ground, they will then furnish the base of the wall with foliage, instead of running away at the extremities. If they do not die down so far as this, they will need to be cut down, unless the bottom of the wall is wanted for other plants. The pruning-back may be done in February. We may mention a few, C. l. candida, C. L. nivea, and C. l. violacea. Clematis of the Jackmani type require a deep rich soil, and with plenty of space for the roots to ramble. They flower on the strong summer shoots, and form dense masses of bloom. The plants require a heavy mulch before winter, which may be forked in at the end of winter. The pruning may be done then or at the present time; for late bloom April is a good time to prune. They should be pruned hard back, whether in beds or on walls and poles. The varieties are numerous, and mostly beautiful. John Gould Veitch, Juanita, Jackmani alba, John Murray, Lady A. Neville, and Lady Bovil are good types of this race. The best way to prune Escallonias and Ceanothus is to cut out the old shoots and lay in a fair amount of young wood each year, and thus secure abundant flowering of the various species.

DISLODGING SNOW.—After a heavy fall of snow followed by a severe frost, very little work can be done outside; all the smaller evergreen trees and shrubs should be looked over daily if snow fall, to see that the pressure of the snow is not breaking down the branches. The snow can be easily dislodged from the taller specimens by means of a long staff having a crutch-end wrapped round with soft cloth, with which the branches should be lifted and allowed to fall, thus dislodging the snow without injury to the plant.

PROPAGATION.—Plenty of work may now be done in the matter of propagating and potting various kinds of plants required in the flower garden for summer bedding. Dahlias should be taken from the place where they have lain during the winter, and placed in a gentle moist temperature under the stage of the propagating-house or any similar place, so as to cause them to start. So soon as the young shoots are about 3 or 4 inches long, they should be pulled off with a heel, if possible, and placed singly in small pots containing good friable soil, in a temperature of about 60° or 65°, where they will root very readily. As soon as the pots are full of roots, they should be potted on into larger pots, using good rich soil, large 48-sized pots being a useful size to grow them in. They should then be placed in a slightly cooler temperature, and with an occasional pinching, and the usual hardening off as the season advances, they will make good serviceable plants by the time they are required for the flower garden. Some people divide the old tubers of Dahlias as soon as they have started, and pot them at once into 32 or 48-sized pots; but I believe that plants obtained in the manner first alluded to flower more freely, and grow on much quicker when first planted out than those having the old tubers attached to them.

CANNAS.—Few plants are more easily grown and propagated than these beautiful plants, now so largely used in sub-tropical bedding. They can be raised from seed, and the good strains come true from seed. If the seed is soaked in tepid water twelve to twenty-four hours previous to sowing, the process of germination will be much assisted. Propagation can also be effected by division of the root-stock, which work should be proceeded with at once. If each portion of the root-stock with a bud and roots attached be placed in 4-inch pots, containing rich porous soil, and plunged into bottom-heat of 60°, or thereabouts, they will quickly resume root-action, and grow rapidly; they can be propagated without any bottom-heat, but it is a slow process compared with the other, and should not be adopted, excepting large quantities are required. Another way is to divide and place the roots at a certain distance apart in boxes containing the same sort of soil, and then if they are stood in a moist heat, growth soon commences. They can be transferred from the boxes to the open ground when the proper season for doing so arrives. In sheltered situations with a dry subsoil I have seen Cannas wintered safely in the open ground with a covering of the depth of 1 foot or so of dry litter or Cocoa-nut fibre refuse over the crowns, but this plan of protecting the plants cannot be generally adopted.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

CURRANT BUSHES.—Red and white Currants will produce full fruit for many years if closely spurred-in, and with or without leading shoots being left at the ends of the main branches. Sometimes the fruit-spurs get too thick together, in which event, some of them should be cut away. Black Currants should have the very old and the fruitless shoots thinned out, cutting these mostly to the ground level, but leaving sufficient new wood to replace that which is cut out, also shortening back strong young shoots if the bush is too thin. After pruning, afford the bushes a good mulch of rich manure, and in the case of old quarters the addition of fresh soil is to be recommended. Currant bushes are much benefited by heavy watering with liquid manure, one or two of which may be afforded before growth commences, as well as during the summer. Exhausted soil under bushes would be much improved if some good fresh soil or burnt earth could be incorporated with it. This would also replace to a certain extent that which gets removed when clearing off summer weeds. Stiff soils only should be shallow dug with a fork between the rows of bushes, and are benefited by previously dressing them with burnt garden refuse. Light soil, if long under bush fruits, becomes so full of roots, that digging amongst the bushes, unless it be for a foot or two in width in the middle of the alleys, is unadvisable, and mulching and surfacing with fresh soil, &c., are the only suitable methods of enrichment.

APRICOTS.—In weather that will enable the gardeners to work efficiently, push forward the

pruning and nailing of Apricot trees; and as these fruits suffer from a too free use of the knife, the aim should be to check the tendency of the tree to make very strong shoots, by timely root-pruning or replanting. Although it is now late for root-pruning established trees, those which have been planted not longer than two or three years, and are growing too vigorously, may still be so treated. In doing this, open a trench at 4 feet from the wall, and cut back all the strong roots met with to about 3 feet from the stem, which will prepare the trees for replanting early in the autumn of the current year. It is generally admitted that it is owing to excess of vigour that whole branches die off, and even entire trees at times. Where the preparation of fruit tree borders is being undertaken at this date, if the natural soil should be found unsuited to the Apricot, I would advise the construction of a 4½-inch brick wall, at 4½ feet distant from the fruit wall, so as to form a narrow border for the roots, and then, by lifting and replanting the trees until they come into free-bearing, I believe there would be fewer failures than is now the case, and little or no winter-pruning necessary, except that young trees would need to have their young shoots shortened. Some few years ago, after root-pruning the trees on our principal Apricot wall, a trench was taken out parallel to and 4½ feet distant from the wall, and a wall of chalk was built, 9 inches in thickness, to confine the roots, stout boards being used in forming the confining framework, these being kept in place with stout posts, and the chalk well rammed together as it was filled in. This made a strong wall, the top of which was a few inches below the ground, thus preserving it from frost. The results of confining the roots in this way have been good. If brown-scale is found on the trees, paint them with Gishurst soap, 3 oz. to the gallon of water; or some other safe insecticide. In training the branches, examine every one of them, and see that old ties and other fastenings which are still serviceable do not grip too tightly, and make all secure for the season. I may say here, that of all methods of fastening trees to walls, that of nails and shreds is the worst.

FRUITS UNDER GLASS.

STRAWBERRIES.—Where supplies of ripe fruit are required within twelve weeks from now, an early variety must be selected with strong crowns (the weaker crowns will answer for late forcing), the pots washed if dirty, the soil pricked out to a slight depth, renewing it with rich loamy soil, pressing it firmly all over with the fingers, and cutting away any wholly decayed leaves. If a heated brick-pit is at command, it is a good place wherein to plunge the pots up to the rim, in a bed of hard tree leaves, there to remain without watering them once, unless the soil be very dry, till they come into bloom. The bed should have been made up about two weeks, and got slightly warmed previous to plunging the pots. The top-heat must not exceed 50° at starting, nor the bottom-heat 75°; therefore, half plunging the pots is at first safer than wholly so doing. A slight dewing over after sunny days is desirable, but in dull weather the moisture of the bed will be sufficient. Always leave on a small amount of ventilation, but affording more when the day temperature reaches 60°. Every week there should be a slight increase of top-heat; and when a quantity of bloom shows on the plants, shift them into a more airy place, and afford water if necessary. Any plants whose leaves start to grow much in advance of the bloom-spike are useless. Sometimes aphis is troublesome, and must be got rid of by fumigation. When a number of plants is removed, slightly turn over the leaves, rearrange the rest of the plants, and introduce more of them, remembering that as time advances fewer plants will meet the demands for fruit.

VINERIES.—The late vineries may now be pruned and generally put in order for the season, as was recommended in earlier calendars. Take every care to eradicate mealy-bug by the use of smothering mixtures, laid thickly on the rods after clearing them of the more loose parts of the bark. Keep the Vines very cool previous to starting them.

GOOSEBERRY-HOUSE.—The bushes should be pruned forthwith, dressed afterwards with quick-lime made into a wash and used immediately, and the surface-soil removed to a slight depth from below the plants, replacing it with fresh rich soil; a mulch need not be used before the fruit begins to colour. Indoors, Gooseberries are usually grown on trellises, and afforded plenty of sunlight; they will not do satisfactorily under the shade of other things. The house may soon be started at 40° to 42° by night. The Cape Gooseberry, Physalis edulis, grows well under Peach-house or Vinery treatment, but it also needs full sunlight. It crops abundantly on one-year-old shoots, and needs a trellis for its support. The treatment afforded the English Gooseberry is suitable also for it.

CHERRIES.—A house of these fruits, and almost any kind of a house that is very well lighted, in any aspect, if started now, will produce ripe fruits from pot trees, trained or untrained, or such as are in borders, in about three months. Start at a temperature at night of 40°, and by day of 45° to 50°. The same kind of pruning as that suited to the needs of sweet Cherries out-of-doors is the one to adopt. If in pots, prick out the inert top soil, replacing it by good rich loam and manure, rammed firmly; and if in borders, take away the upper crust, also redressing them with fresh soil, &c. See that the drainage is in the best order, both in borders and pots, and when starting the trees, let them have a thorough soaking of water. Do not let the temperature rise higher than 50° by artificial heat for the first month, damping down twice daily, more or less in amount according to the weather. Good varieties for forcing are Knight's Early Black, Early Rivers, Early Prolific, Werder's Early Black-heart, May Duke, Royal Duke, &c.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Buxted Park, Uckfield.*

EARLY PEAS. — Preparations should now be made for sowing these on a warm border. Little or nothing is gained by sowing earlier, except in very warm sheltered situations, on warm, light, dry soil. On heavy land, we have found that to sow earlier entails much trouble, and it often results in disappointment, unless the winter and spring are unusually mild. Many are the devices of gardeners to forestall their neighbours in the production of an early crop of Peas. Many do so by sowing the seed in pots, on turves, in troughs, boxes, or other contrivances; but all these modes necessitate the use of cold frames and kindred structures to harden off the plants previous to planting out, and it is not every establishment that can command these, especially at this season. The most portable and also the simplest mode that I have adopted is to procure some stout match-boards, and, having cut them into lengths the width of the border, to take off one side of the edge that is ploughed. This will leave a rebate on which glass can rest with ease, when the boards are stood up edgeways. The plan is to manure the ground intended for early Peas in the autumn, allowing it to remain till the time of sowing before digging it in. By treating the ground in this manner, the soil which is turned up is much drier and warmer than that on the surface, which has been exposed to frost, snow, and cold rains. The seed is sown as digging proceeds, as this saves trampling on the ground afterwards, for the soil, being freshly turned up, does not adhere to the boots. As each row is sown, match-boards are stood up edgeways on either side, about 2 inches from the drills, with the rebates inside. Pieces of glass, as wide as the space between the boards are then laid on, their edges resting on the rebates formed as described above. The seed soon germinates, and as frost and cold winds are excluded by the match-boarding, the young plants make rapid progress. If the boards are fastened together, they may be removed bodily during fine weather, and replaced at night, with little trouble. By this mode of treatment, there is no difficulty in gathering Peas by the first week in June, and some of the more tender kinds may be had by the second or third week of that month. For early sowings I prefer such varieties as Chelsea Gem, Exonian, or Sutton's A1, which are all good, and are better flavoured than the round varieties.

BROAD BEANS.—Make a sowing of these in the open. By planting two rows, 9 inches apart, and allowing 4 inches between the seeds in each row, ample room will be provided till the plants are 2 or 3 inches high, when every alternate plant should be taken out. If more than one row be required, they should not be less than 6 feet apart, a dwarf crop of early Turnips, Lettuce, Spinach, or the like, being sown between.

SMALL SEEDS.—Where early Celery is required, make a sowing of some white kind, as these varieties blanch more readily than the red or pink ones. It is well to sow the seed not too thickly, or the plants may get drawn while in a young state. The great secret in growing early Celery is to prevent the young plant receiving any check whatever. The seed should be sown in rich soil, and the plants kept growing till planted out, taking care that they do not become drawn either by overheating or overcrowding.

RADISHES should be sown to form a succession, sowing the seed thinly by itself, and not with other crops. See that all young Carrots, Cauliflowers, and Lettuce get plenty of air when the weather is mild, but avoid cold draughts. The Cauliflower is very apt to damp off if kept a little too close.

SPINACH may now be sown in the open, either between the rows of Peas or Broad Beans, or by itself. If the ground has been dug for some time, and is wet and sticky on the surface, wait a few days till it is drier, for the seed would only perish if sown when the soil is in uncongenial condition.

PLANTS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

VIOLETS FOR WINTER AND SPRING FLOWERING.—Where a daily supply of these flowers is required, the best varieties to grow are New York, Marie Louise, Lady Hume Campbell, de Parme, Czar, or Victoria Regina, and White Queen. The three first varieties should be planted in garden frames placed on beds of cold manure, and protected from frost; the last three named are best planted in brick span-roof pits, about 8 feet wide, and receive no protection in frosty weather but what the closed lights afford, and be afforded abundance of air night and day during fine weather. Those in the protected frames, if well watered at the time of planting, say, the beginning of October, will not require any further watering during the first three months of winter. Those in the unprotected pits will flower much later, and onwards into the spring. For furnishing a supply during such weather as we have had for the past month, a few lightfuls of New York and Marie Louise should always be left ungathered from the beginning of November. If damp proves troublesome in the frames, cover the soil with powdered charcoal.

STOVE FLOWERING PLANTS IN POTS.—Allamandas, Bougainvillea glabra, Clerodendron Balfouriana, and other deciduous plants that have been kept comparatively dry in a cool house during the winter, and are required for decorative or exhibition purposes early in the season, should be pruned well back, shook out of the old soil, and repotted into a compost of good turfy loam, leaf-mould, and peat, in about equal parts, with a nice quantity of rough silver-sand, and a free addition of dry cow-dung and started into growth at once; let the pots be clean and well-drained, and for training use strong deal stakes painted green, but not more than required of them. Ixoras for the same purpose cut back and repot, find them more peat than for the above plants, and they may be placed at the warmest part of the stove. Rondeletia speciosa major may receive the same treatment; water well with tepid water, and syringe daily. Pot Dipladenias into clean, well-drained pots. Soil should be about equal parts of good peat and loam, with a little silver-sand; let the young shoots twine on their string till they are required for the wire trellis. They delight in a hot, moist temperature; a wood trellis over a hot-water tank is a suitable place for them. As the days become longer and warmer, let the stove range 5° higher at night, 5° to 10° higher by day.

TUBEROSES.—Pot a good batch of bulbs for succession about every three weeks, single bulbs into 5 or 6-inch pots, or three bulbs into 8-inch pots, clean and well-drained. A good loam, with some leaf-mould, and sea-sand, will suit them, and give a nice bottom-heat to start them at this season.

SHOW AND FANCY PELARGONIUMS. — The best place for these is a span-roof house, with a wood-staging for the plants, as near the glass as possible, where they will get plenty of light and air all about them. Old plants will be growing apace; regulate the shoots, and keep them well down over the sides of the pots. For exhibition plants, use pots with perforated rims. Pot young plants as required into good turfy loam, leaf-mould, peat, and sea-sand; do not stop them until about three weeks afterwards, and do not over-water at this season; the temperature should be 45° by night, and 50° to 55° by day.

EDITORIAL NOTICES.

PLANTS, &c., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

SATURDAY, JAN. 28—Royal Botanic Society.

SALES.

MONDAY, JAN. 23 { Hardy Border Bulbs and Plants, at Protheroe & Morris' Rooms.

TUESDAY, JAN. 24 { Special Sale of Gladioli, Japanese Lilies, Pearl Tuberoses, &c., at Protheroe & Morris' Rooms. Orchids from F. Horsman & Co., at Protheroe & Morris' Rooms.

WEDNESDAY, JAN. 25 { Japanese Lilies, at Protheroe & Morris' Rooms. Plants at Stevens' Rooms.

THURSDAY, JAN. 26 { Lily of the Valley Plants and Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, JAN. 27 { Consignment of Newly-imported Orchids from Charlesworth, Shuttleworth & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—38°.3.

The Gardeners' Royal Benevolent.

THE annual meeting held on Tuesday last at Simpson's, under the presidency of Mr. HARRY VEITCH, was of the usual satisfactory character. The main business of the year was transacted a short time since. On Tuesday last there was little to be done except formally to confirm what was done before, to appoint the officers for the year, and to thank those who served last year for their services. Most of the officers remain, but a few changes were made in conformity with the regulations. The financial statement shows a balance on the right side of £935 11*s.* 7*d.*, as contrasted with £898 16*s.* 11*d.* at the corresponding period of last year. The annual subscriptions for the year amounted to £1397 13*s.* 6*d.*, much too small an amount, considering the numbers of gardeners in Great Britain and Ireland, and the many claims on the Institution which cannot be met for want of means. The donations include one of £500 as a thank-offering on the part of Mr. and Mrs. H. J. VEITCH, on the occasion of their silver wedding. The collecting cards brought in £219 10*s.* 8*d.*, besides which there are two sums of £695 3*s.* and £330 13*s.* 9*d.* respectively, one of which, we presume, represents the amount collected at or in consequence of the annual dinner. The investments amount to upwards of £29,000 in Consols and other approved stock. On the other side of the account we find the amount granted in pensions amounted to £2634 6*s.* 8*d.* The annual dinner is debited with £76 18*s.* 9*d.*, but nothing is said as to the receipts from this source, unless the surmise above-mentioned is correct.

It was proposed that J. MITCHELL, aged seventy-seven, and ELIZABETH ROGERS, aged sixty-three, be, in accordance with the rules, voted on the pension list without election from December 25, 1892. This proposition was seconded, and carried unanimously. In consequence of two deaths among the pensioners, it was also proposed that, after the ten candidates were elected, the two next highest on the poll be elected, making, in addition to the two above mentioned, twelve pensioners. This motion was unanimously adopted.

Messrs. H. CUTBUSH, G. MUNRO, J. WEBBER, H. WILLIAMS, and B. WYNNE were appointed scrutineers, and later in the afternoon declared the poll, those with an asterisk prefixed being elected pensioners of the Institution. The total number of votes polled was 42,337.

John Butler, 1559; Jane E. Nichols, 1156; *W. Coleman, 1992; *James Munro, 2375; *H. Woolford, 2147; *T. H. Bowler, 1860; *Henry Bridden, 2975; Clara E. Brown, 612; John Collier, 184; Henry Fielder, 725; Emma Kendall, 1240; *George Macintosh, 2932; Ann Nixon, 587; *James Ricks, 2160; Thomas Thomas, 1030; *Samuel Tisdale, 2137; *George Woodgate, 2183; Francis Woodhams, 737; Thomas Bundy, 97; James Clarren, 514; John Comber, 674; David Cornell, 34; Hester Falconer, 147; Thomas Gooch, 845; *Mary Gray, 2012; John Guyett, 1113; William Hale, 49; Ann Harding, 633; *Margaret Kefford, 2837; Richard King, 475; *Agnes Merritt, 1931; Ambrose Minty, 170; John Pearcey, 131; Robert Pettit, 601; James Strachan, 129; Eliza Webb, 252; William Pamplin, 760.

When the business of the day had been concluded, was held the annual friendly dinner, under the presidency of H. SEYMOUR FOSTER, Esq., M.P., who was supported on the right by Mr. H. J. VEITCH, and on the left by Mr. N. SHERWOOD. The chairman, during an appropriate speech, when proposing the toast of the Institution, took occasion to congratulate the members upon the good and economical management of the funds, and upon the wise alterations that had been made in the rules at the recent revision. We think he was right in recommending the Institution as worthy of support in proportion to the encouragement it gave to gardeners to help themselves. Three instances were given by Mr. FOSTER to show that in the election on Tuesday these facts were not lost sight of. In one case, a gardener had been elected at the age of seventy-seven years, and who had been a subscriber to the Institution for no fewer than forty-six years; in the second case, for as many as thirty years; whilst in a third case the unfortunate applicant had been reduced to this extremity through the attack of some brain disease, at the comparatively early age of forty-seven. This man had collected £10 in 1887 towards the Institution. This is as it should be, and we think that the more clearly our gardeners see that these matters are considered during an election, the more ready will they be to become members. All will regret that the funds did not admit the election of all the candidates—none of whom are undeserving or ineligible; and we feel sure that greater efforts will be made during the coming year than have been made in the past, although we would not for a moment disparage the hard work that has already resulted in the success which has been achieved. The toast of the Institution was coupled with the name of Mr. SHERWOOD, who touchingly referred to the enforced absence of Mr. JNO. LEE, of Hammersmith, who has seldom, if ever, been absent from the annual meeting before, for a period of about fifty years. All who have worked for the Institution will acknowledge the splendid support it has received from Mr. LEE, and will join in the hope expressed on Tuesday, that the indisposition from which he is suffering will be but temporary.

THE DOUBLE COCOA-NUT AT KEW.—In July, 1890, Kew received two germinating nuts of the double Cocoa-Nut (Lodoicea seychellarum) from the Seychelles, where this Palm is a native. They were nursed along in one of the small private stoves until the beginning of last summer, when they were transferred to the Victoria-house, and placed over the tank in which the Victoria is cultivated. The water in this tank is kept at a temperature of about 75°, the temperature of the atmosphere varying with the sun's warmth; no shading is ever used, and the house is well ventilated. These conditions are suitable for the Victoria regia and for many other plants cultivated in that house, notably some rare and interesting Palms. The fact that such plants as Manicaria, Mauritia, Pholidocarpus, Borassus, Hyphæne, Bismarckia, and Socratea, had not only lived but grown most vigorously in this house, whereas in other houses and with most special treatment they either would not grow or grew very badly, naturally suggested that the double Cocoa-nut would most likely thrive there too. The plant was, therefore, in June, placed over the water-tank, with the bottom of the pot (a 15-inch) touching the water; the nut, still attached, was held in position, and the plant was allowed all the light, air, and moisture that the conditions of the house already mentioned afforded. Here it grew rapidly, the two leaves it made during the summer being very large, and as firm almost as iron. It was hinted that all this growth was kept up by the large quantity of nourishment stored up for this purpose in the enormous seed, and which was absorbed by means of the stout "umbilical cord" connecting the seed with the baby giant. The plant grew so large that the pan it was growing in looked far too small, and after all, there might be plenty of root-growth, notwithstanding all that the doctors had said. A pot 2 feet in diameter was therefore prepared, and the pan carefully removed preparatory to repotting. It turned out that not only had the plant rooted, but the ball of soil was enclosed in a close network of healthy rootlets, with tips which told a very plain story. The nut may be feeding the seedling still, but there are roots enough, I feel certain, to enable it to get along very well on its own account. "Water culture" is a really wonderful restorer of sick plants. It also answers for many plants which, tried in any other way, have always refused to do any good at all. Some day I hope to be able to tell an interesting story of the effects of water culture on plants which, on the face of things, when wild appear to thrive best where water is scarcest. The dimensions of the Lodoicea when re-potted were:—Seed, 1 foot by 1 foot by 8 inches. Number of perfect leaves, three; first leaf: petiole, 18 inches long; blade, 2 feet long by 2 feet in diameter; second leaf: petiole, 2½ feet long; blade, 4 feet by 4 feet; third leaf: petiole, 3 feet long; blade, 4½ feet by 4½ feet; number of folds in blade, fifty-six. This last leaf is not yet quite unfolded. The plant is barely two and a half years old. *W. W.* [See figs. 12, 13, 14, and the supplementary sheet.]

MACROZAMIA SPIRALIS.—The specimen represented in the supplementary plate, is one of a pair which was purchased for Kew at an auction sale in London last July for twenty-nine shillings. They each weigh about half a hundredweight, and measure round the egg-shaped trunk 6 feet. These two were the largest of an importation of Australian Cycads, which probably did not realise when sold more than the cost of carriage. There is practically no market for such plants in England. The plant in the picture is exceptional, in that it produced six full-sized male cones simultaneously, each cone being 8 inches long by 2 inches in diameter, bright green when young, plum-coloured when mature. The female cones are much larger, examples in the Kew museum measuring 12 inches in length by 8 inches in diameter, and being composed of large broad-topped scales, each of which bears a pair of large nut-like seeds. All the Macrozamias are ornamental, and they all thrive in an ordinary stove. They are exceptionally valuable for furnishing large tropical houses. M. spiralis is the common type of a group, which in stem and foliage closely resemble each other, viz.,

Germination of the Double Cocoa-nut in the Royal Gardens, Kew.

Macrozamia spiralis, with Cones, Royal Gardens, Kew.

M. Fraseri, magnificently represented at Kew; M. Moorei, a comparatively new discovery in Queensland, where it forms pillar-like trunks 20 feet high; M. corallipes, and the new M. Dyeri. The most beautiful of all, however, is M. Macleayi, the specimens of which in the Palm-house at Kew, at least equal in elegance the finest examples of Cycas revoluta. Next to this I should place M. Hopei. Of course, some of the newer species may be as good or better garden plants than any of these, but as yet we know them only as small plants. M. heteromera, with bifurcate pinnæ, is one of the most interesting of these, and M. Fawcetti and M. Dyeri also look promising. The Australian representatives of Cycadaceæ comprise Macrozamia, about a dozen species; Cycas, four species; and Bowenia. M. spiralis is said to have been introduced into England in 1796 from New South Wales, where, according to Mr. C. Moore, Director of the Sydney Botanic Gardens, it extends along the coast from Port Macquarie to very near the borders of Victoria, a distance of nearly 300 miles. "It is a gregarious plant; wherever found it is in great abundance, and massed together. In many places it occupies large areas, and indicates a poor stiff ironstone clay soil. In some of its southern habitats it is found with perfectly cylindrical stems, at least 6 or 7 feet high, and from 2 to 2½ feet in diameter; but about Sydney and northward the stem is cone-shaped, and rarely rises above the ground more than from 6 to 18 inches. 'Burrawang' is the name by which it is known to colonists. The upper part of the stem is densely covered with a fine soft wool, which has been used in some districts for stuffing beds, and a good starch has been obtained from the seeds, which also, when washed, or sliced and steeped for some days in running water, or roasted, were largely used by the aborigines for food. Without some precaution of this kind, they are in a fresh state dangerously acrid." (*Notes on the Genus Macrozamia*, by C. Moore, F.L.S., Sydney, 1883). *W. W.*

THE ROYAL HORTICULTURAL SOCIETY.—We are glad to see that the Society has issued a revised list of the awards made at the several committees, completed up to date. Such a document is not only essential to many of us at the present time, but it will be very valuable from an historical point of view, as showing what were considered the best and most noteworthy varieties in the middle and latter half of the present century. No doubt exception could be taken to some of the awards that have been made, as well as to errors of omission, but we feel confident that no other body but the Royal Horticultural Society could have produced a better or more impartial record, or, indeed, anything approaching to it. The well-attended meetings of the committees, and the excellent and interesting fortnightly meetings, prove the correctness of our statement. No one who visited the fortnightly meeting at the Drill Hall, James Street, Westminster, on Tuesday last, would have thought it midwinter. The number of committeemen present was large, a fact not to be wondered at, when we mention that there were no fewer than ten meetings of one sort or another on that day, and that many or most of those present had to attend at more than one of the ten. Besides this, the show was very interesting. The severe weather did not prevent Messrs. Low, Sander, Williams and Veitch from sending choice Orchids. Mr. Bunyard vindicated the unconquered (invicta) county of Kent by a splendid lot of Apples, and Mr. Cheal did valiantly in the same way for Sussex. Cyclamens lent colour; whilst a fine group of Begonia Gloire de Sceaux came from the gardens of Leopold de Rothschild, and attracted the attention of all the connoisseurs. The plants were well-grown, the foliage a rich deep bronze, and the flowers deep rose coloured, and well set up above the foliage. Among the Orchids was a well-grown plant of a Cycnoches, shown under the name of C. Mannii, but supposed to be the male plant of C. pentadactylon. It was shown by W. Mann, Esq., Ravenswood, Bexley, and bore no fewer than 247 expanded flowers. For the rest, see our report in another column.

NEW RAILWAY RATES.—We have received the following letter from Mr. Goodchild, who did such good service in this matter some time since, and who compiled the elaborate table which we published in 1889. "My attention has been drawn to the article on this subject in your last issue, and I am glad to see that at length the interest of the trade in this somewhat complicated subject has been awakened. I believe it is not yet too late to do something, although the extent of that something may be somewhat problematical. The noose is adjusted round the neck of various trades, but (pardon the sepulchral simile), the bolt is not yet drawn. The position of the matter at the present time is not what it was in 1889. Since then the classifications and maximum rates and charges have received the sanction of Parliament, and can be enforced; accordingly the railway companies have the advantage of the position. In replying to a letter from R. Farrance in your issue of January 18, 1890, I, in a letter which appeared in your issue of February 1, 1890, wrote as follows:—"When, however, a comparison is made between the actual rates now paid by Mr. Farrance and the proposed maxima, I quite agree that he will be at a great disadvantage, that is, if the company choose to avail themselves of their full powers to charge their maxima. This is what the trade has hitherto failed to realise, and what my association is endeavouring to obviate. Undoubtedly a vast increase in rates will be the result of the enquiry unless steps be taken to prevent it. When the labours of the enquiry are ended, and the railway companies commence to wield their newly-acquired powers (their protestations to the contrary, notwithstanding), I imagine that the ranks of your correspondents having the same experience as Mr. Farrance will be considerably enlarged. Their consolation of vainly beating the air will be very poor," &c. My object in writing this letter is not to justify my opinion then expressed, but to point out that there is still a *locus pœnitentiæ*, but no time to lose. The companies are now placing out feelers, and inviting the trades to communicate with them, and for this purpose are fixing the rates purposely higher than those formerly charged. Many trades are taking advantage of the *modus vivendi* thus created; but woe to those who do not. When once this opportunity has passed, sad indeed will be their state, for they will be made to bear the burdens of which the other trades will be relieved. In other words, the concessions made to the trades which now agitate for them will be given at the expense of those which do not. Possibly a reference to the articles in your issues of April 20, August 10, October 26, November 2 and 16, December 14, December 28, 1889; January 18, January 25, and February 1, 1890, will refresh the minds of your readers as to the importance of this matter. *F. C. Goodchild, Croydon.*

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, January 23, 1893, when a discussion will take place on the papers (1) by Mr. P. D. Tuckett (fellow), entitled "A Short Explanation of the Proposed Bimetallism as affecting British Interests;" and (2) by Mr. A. Goddard (professional associate), entitled "The Currency Question and Land," read at the last meeting. The chair to be taken at 8 o'clock.

THE SELFISH BOTANIST.—There is a type of botanist who is becoming a dreadful nuisance, and he ought to be abated. Wordsworth said he would despoil his mother's grave for a rare plant; and yet in Ireland, according to the *Irish Naturalist*, they stimulate him to activity at meetings of field clubs by offering prizes for a collection of the rarest flowering plants in the ground covered by the excursion. If the collection was of any more use to anybody than a bundle of dry hay, one might not complain. But is it? In this particular case, the only practical result of the prizes must be, not the shedding of new light on biological problems, but simply the extinction of rare forms in the eastern part of Ulster. Perhaps this prize-giving accounts for the disappearance of Saxifraga oppositifolia from these regions. But the disgusting thing about the haymakers who call themselves botanists is, that they are now carrying on a vulgar trade under the cloak of science. We know of a place in Essex where an extremely rare Orchid is to be found. It is with pain that we recently heard it had been ransacked, but not with surprise that we afterwards learnt specimens were being advertised at a high price for sale to collectors. *Daily Chronicle.*

BOROUGH OF CROYDON CHRYSANTHEMUM SOCIETY.—The date at which the above will hold their autumn show is unavoidably altered from November 8 and 9 to November 14 and 15.

THE ROYAL ACADEMY OF SCIENCES OF TURIN, in accordance with the last will and testament of Dr. Cesare Alessandro Bressa, and in conformity with the programme published December 7, 1876, announces that after January 1, 1891, a competition for the ninth Bressa Prize was entered on, and to which according to the testator's will, scientific men and inventors of all nations are admitted. A prize will therefore be given to the author or inventor, whatever be his nationality, who during the years 1891—94 "according to the judgment of the Royal Academy of Sciences of Turin, shall have made the most important and useful discovery, or published the most valuable work on physical and experimental Science, Natural History, Mathematics, Chemistry, Physiology and Pathology, as well as Geology, History, Geography, and Statistics." The term will be closed at the end of December, 1894. The sum fixed for the prize, deducting the income-tax, will be of 10,416 (ten thousand four hundred and sixteen francs), £420. The person who intends to compete must declare his intention within the time above-mentioned, by means of a letter addressed to the President of the Academy, and send the work with which he competes. The work must be printed, manuscripts are not admitted. The works of the competitors, which do not obtain the prize, will be returned to them, when asked for within six months from the adjudication of the prize. None of the Italian members, resident or not resident, of the Turin Academy can obtain the prize. The academy awards the prize to the scientific man considered most worthy of it, even if he has not formally entered upon the competition. The President of the Academy, M. Lessona; the Secretary of the Commission, A. Naccari.

HORTICULTURAL INSTRUCTION.—We understand that Mr. G. Garner, Amberwood, Christchurch, Hants, has been appointed by the Poole Technical Instruction Committee to deliver a course of lectures on horticulture, the first of which was given at Parkstone on January 10 on "The Chrysanthemum."

—— Dr. Jas. Clark, M.A., of the Yorkshire College, Leeds, is giving a course of twelve lectures on "Horticulture" in the National School, Howden, on Monday evenings. The preliminary lecture was held on Monday, the 9th inst. Dr. Clark, who is thoroughly master of his subject, is an able and fluent lecturer, who can impart knowledge in a way that everyone can understand. A summer course was given last year, and the average attendance was then nearly one hundred, which was very creditable considering that the lectures were given in the midst of the election campaign. To add to the interest of these lectures, Messrs. Dickson of Chester, Ware of Tottenham, and Cliburan of Altrincham contributed specimens of cut flowers for the inspection of the class. Howden is in the centre of a horticultural district, and possesses a first-class horticultural show.

—— Two courses of six lectures, in six different centres, upon fruit and vegetable culture, have just been completed in the county of Norfolk, by W. K. Woodcock, under the auspices of the Technical Education Committee of the Norfolk County Council. Most of these lectures have been well attended, and much interest has

been shown in the subjects treated upon, insomuch, that at the meeting of the County Council on January 7, it was decided to appoint Mr. WOODCOCK as permanent lecturer and instructor on horticulture for the county. Previous to entering upon this permanent engagement, however, Mr. WOODCOCK, has to fill a prior one with the Local Committees of Bath, Wincanton, Yeovil, and Taunton, in the county of Somerset, to give short courses of lectures in each of these districts, commencing on Monday, January 16, and continuing until April, after which he returns to Norfolk. In the meantime, Mr. THOS. BUNYARD has been engaged by the Norfolk Technical Education Committee to give one or two courses of similar lectures (from the same syllabus) to those given by Mr. WOODCOCK. The lectures delivered by Mr. WOODCOCK, deal with the following subjects:—I. Allotment Gardens and Potato Culture; II. The Orchard and its Management; III. Garden—Root Crops; IV. Small Fruits; V. Garden—Green Crops; VI. Insects and Fungi.

MR. ALFRED PARSONS.—This distinguished floral and landscape artist, who spent a large portion of last year painting in Japan, gave an exhibition of his pictures in the Imperial Hotel, in Yokohama, towards the end of November. The invitation issued was taken advantage of by nearly the entire foreign community, and the local papers were loud in their praises of Mr. PARSONS' work. "We who live among the beauties of Japanese foliage and flowers," says the *Japan Mail*, "and are accustomed to see them perpetually under her skies of enchanting softness and delicate purity, do not perhaps realise fully what is meant by such a *tour de force* as Mr. PARSONS' perfect representations involve. But to the discriminating section of the public in the West, the pictures will open a new vista of delight. We speak chiefly of foliage and flowers, because, although Mr. PARSONS' landscapes command no less attention, his trees and blossoms stand on a plane of artistic achievement far above anything we have ever had the pleasure of seeing in the same line."

VEITCH MEMORIAL PRIZES.—At a meeting of the trustees of the Veitch Memorial Fund, held on Tuesday last, the 17th, at the Royal Horticultural Society, James Street, Victoria Street, S.W., Dr. ROBERT HOGG in the chair, it was decided that the medals and prizes placed last year at the disposal of the Royal Horticultural Society and the Manchester Botanic Gardens, but not competed for, should be again offered this year, viz., at the Temple Show to be held May 25 and 26, a Medal and prize of £5 for the best six hard-wooded greenhouse plants in bloom; and at the special exhibition of Orchids to be held in the Manchester Botanic Gardens, May 19, a Medal and prize of £5 for the best Hybrid Orchid in bloom, already in commerce; and a Medal and prize of £5 for the best hybrid Orchid in bloom, but not in commerce. It was also decided to place a Medal and prize of £5 at the disposal of the Royal Horticultural Society to be competed for at the Great Fruit Show to be held at the Agricultural Hall, Islington, on August 29, and three following days. Also a Medal and prize of £5 to be competed for at the Ghent Quinquennial International Exhibition to be held in April, for the best Hybrid plant in the exhibition. And a Medal and prize of £5 to be competed for at the annual exhibition of the Clay Cross Horticultural Society in August.

FRUIT FROM SOUTH AFRICA.—Messrs. DONALD CURRIE & Co., following up the special efforts made by the Castle Line last season in connection with the import of Cape fruit to this country, have considerably extended and increased the number of the cool chambers provided in their steamers for the conveyance of fruit. The "Warwick Castle," due in London this week, brings a consignment of Apricots, and a large shipment of Grapes and other fruit is expected to arrive shortly. The Castle Line some time ago fixed the rate of 40*s.* per ton for Apples and other fruit carried as ordinary cargo. A pamphlet, published last winter by Mr. P. A. MOLENO, on the cultivation, packing, and shipment of fruit from South Africa, was very favourably noticed in the press, and copies of this *brochure* may be obtained free on application to Messrs. DONALD CURRIE & Co., 1, 2, 3, and 4, Fenchurch Street, London, E.C.

WIDCOME INSTITUTE HORTICULTURAL CLUB.—The first meeting of the season of this Club was held on Tuesday, January 10, at the Church Rooms, the President, W. PUMPHRY, Esq., in the chair. Mr. S. J. PARITT read an interesting paper on "Planting and Pruning Fruit Trees," for which he received the cordial thanks of the members present.

TORQUAY DISTRICT GARDENERS' ASSOCIATION.—Over seventy members attended the first annual dinner of the above, held last Wednesday at the Exeter Hotel, Torquay. Mr. W. AINSLIE occupied the chair, and Mr. W. B. SMALE was the vice-chairman. The Society is rapidly advancing, the membership being now over 120, and is in a financially good position. The forming a reference library for members is contemplated, and several valuable works have been promised by the President (Mr. W. LAVERS), Mr. AINSLIE, and others.

STOCK-TAKING: DECEMBER, AND 1892.—The past year has been an instructive one, but the lessons have been broken up by us into monthly parts, of which the twelfth has now to be noticed. A large decrease in the imports of the month, as compared with December, 1891, has to be noted—in fact, with one exception, there is a decrease in values, if not in bulk, all round. The following extract from the summary of imports will be found of more than usual interest:—

IMPORTS.	1891.	1892.	Difference.
	£.	£.	£.
Total value for month	£43,261,980	£37,879,129	—5,382,851
§II.—(A.) Articles of food and drink—duty free	15,358,933	12,837,146	—2,521,787
(B.) — do., dutiable	2,388,078	2,355,531	—32,547
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	11,607,560	9,423,354	—2,184,206
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,942,960	2,812,151	—130,809
§IX. — Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,811,333	1,475,670	—335,663
(B.)—Parcel Post ...	67,605	41,261	—26,344

Much of the apparent fall in imports is due to the great fall in prices in cotton and bread-stuffs; the terrible weather on the Atlantic during the closing weeks of the year has had much to do with the number of deficits; this is shown by the great reduction of ships entering British ports, as compared with December in 1891; hemp, jute, and other raw material have really fallen off, but, as a rule, the foreign producer is suffering much through low prices on this market. The following figures are taken from the general statement in the section devoted to food imports:—

IMPORTS.	1891.	1892.	Difference.
Fruits, raw:—			
Apples ... ... bush.	579,064	588,653	+9,589
Cherries ... ... ,,	...	...	...
Oranges and Lemons ,,	1,434,150	1,140,924	—293,226
Pears ... ... ,,	...	7,620	+7,620
Grapes ... ... ,,	...	2,694	+2,694
Unenumerated, ,,	48,420	27,898	—20,522
Onions ... ... ,,	303,806	306,161	+2,355
Potatos ... ... cwt.	60,705	305,715	+245,010
Vegetables, unenumerated, raw, ... value	£56,277	£52,405	—£3,872

The line unenumerated still remains in connection with these imports. Months since we asked the President of the Board of Trade to substitute details in lieu of these bare words; the other day he informed us our suggestion was referred to the Departmental Committee of the Board for the revision of the accounts, but, owing to the number of more urgent claims in other directions, the Committee have not felt justified in recommending any further distinctions in regard to these articles, for the present. Possibly growers and others would like to know what it is we import, and whence this comes. Agents are very reticent; they are in the habit of keeping their knowledge to themselves—it is their monopoly. However—

THE EXPORTS

for the month show a reduction of 2¾ per cent. on the record for December, 1891—the fall is in value, not in bulk; manufacturers and all concerned in selling have to put up with reduced profits to retain that hold on markets which it would be unwise to let slip, unless, of course, in cases of decided loss. We may just note here that the exports for the month of December amounted to £19,304,636, as compared with £19,839,815. We may add to these exports of British and Irish produce the figures for foreign and colonial merchandise, viz., £6,468,205, as against £5,521,957 in 1891. It may be as well to give some statistics now relating to the trade of

THE YEAR 1892,

and we may be forgiven the exhibition of a little pride over the record of the enormous extent of our trade. Imports and exports added together foot up £650,952,402. The imports give a total of £423,892,178—a decrease in value as compared with 1891 of £11,799,101. It is scarcely needful here to say that the great fall in the price of raw material has enabled us to compete with foreign rivals; though, wonderful to relate, the heavy fall in the price of breadstuffs has not profited the consumer much, bread being sold at the same price now as it was when Wheat was 10*s.* per quarter dearer! Foreign producers send all their surplus stocks here at a cost which not much more than covers handling and carriage. The figures connected with fruits and vegetables are as follows:—

IMPORTS FOR YEAR.	1891.	1892.	Difference.
Fruit, raw:—			
Apples, raw ... bush.	3,147,373	4,514,700	+1,367,327
Cherries ... ... ,,	...	216,990	+216,990
Plums ... ... ,,	...	413,315	+413,315
Pears ... ... ,,	...	637,211	+637,211
Grapes ... ... ,,	...	764,432	+764,432
Unenumerated ... ,,	3,490,211	841,022	—2,549,189
Onions ... ... ,,	4,281,046	4,420,276	+139,230
Potatos ... ... cwt.	3,192,836	3,008,336	—184,500
Vegetables, raw, unenumerated ... ... value	£932,887	£1,016,280	+£83,393

These figures are well worth the space they occupy here; they prove that it pays the foreigner to send his wares to us—that it might pay us to take this trade out of his hands by growing very much of it ourselves. But we are sadly handicapped in the struggle—what with antiquated laws, insufficiency of capital, and transport charges. Turning, for a brief moment, to the year's exports, we record the figures at £227,060,224 as against £247,235 150, a reduction of £20,174,926. We must place a large amount of this reduction to the credit of reduced prices, and so of profits (before referred to). We have quite got the better of the MCKINLAY tariff, and look forward to an extended trade with our cousins over the water. All sorts of efforts are made to "tariff us" out of various markets, and the struggle is a very hard one. Trade is also hampered by gigantic swindling here and there, and by political jealousies and racial antagonisms. We can only hope that efforts will be made in the present year to ameliorate all these conditions, and so bring profit to producer, manufacturer, and worker.

SCOTTISH HORTICULTURAL ASSOCIATION.—The annual general meeting of the Scottish Horticultural Association was held at 5, St. Andrew

Square on Tuesday night, the 10th inst. There was a very large attendance of members, Mr. W. M. WELSH, the retiring president, in the chair. The secretary and treasurer read their annual reports, which were unanimously approved of, and the following office-bearers were appointed for the ensuing year:—Hon. president, his Grace the Duke of Buccleuch; president, Councillor A. D. Mackenzie; vice-presidents, Messrs. W. M. Welsh and John Methven; secretary, Mr. Robert Laird; treasurer, Mr. Alex. Mackenzie. The following gentlemen were added to the council in room of the five retiring members:—Messrs. D. P. Laird, W. M'Kinnon, George Wood, R. W. E. Murray, and Alex. Milne. It was unanimously agreed, on the motion of Mr. Mackenzie, that "The council of the association be empowered to devote a portion of the surplus funds of each year to the relief of gardeners, their widows or orphans, in necessitous circumstances." A vote of thanks was tendered to Mr. W. M. Welsh, the retiring president, for his past conduct in the chair, and also to the secretary and treasurer.

BECKENHAM HORTICULTURAL SOCIETY.—The above Society, which numbers nearly 200 members, held a social meeting at the Public Hall, Beckenham, on Wednesday, January 11, Mr. BAKER, one of the Vice-Presidents, doing the duties of chairman, in the absence of the President of the Society. Professor CHESHIRE lent microscopes and a splendid lot of stereoscopic slides for the edification of the visitors. At the close of the entertainment a handsome silver tea-service was presented to Mr. THORNTON, the Hon. Secretary, by Mr. A. J. BAKER, in the name of the donors and the members of the general committee of the Beckenham Horticultural Society.

EMIGRATION TO THE COLONIES AND SOUTH AMERICA.—We have the following circular for publication from the Emigrants' Information Office, 31, Broadway, Westminster. The January Circulars of the Emigrants' Information Office, and the Annual Editions of the Penny and other Handbooks, with maps, show the present prospects of emigration. A United States circular is also issued for the first time. Branch offices are now organized at Bradford (Yorks), Cardiff, Devizes, Glasgow, Hereford, Leeds, Liverpool, Manchester, Newcastle-upon-Tyne, Reading, and Wolverhampton—mostly in connection with free public libraries, where all information may also be obtained. Emigrants to Canada should prepare to start in March, so as to arrive when winter is over, and the busy season begins. The Canadian Government is offering bonuses of 5 to 10 dols. a head to those who take up land in the North-West or British Columbia. The Dominion Immigration Agencies are now abolished, except at the ports of landing; in Manitoba and the North-West the Dominion land agents now act as immigration agents also, and new arrivals should apply to these. Young men who are going to Canada with a view to learn farming are strongly advised to pay no fee as farm-pupils, but to apply for information to the High Commissioner for Canada, 17, Victoria Street, London; or, to the chief clerk at this office. Work in New South Wales, especially in the towns, continues to be scarce. Sydney suffers, as usual, most of all from the prevailing depression, and no one without money should go there at the present time unless he has work waiting for him. Between February and October last over 14,000 persons registered themselves as unemployed at the government labour bureau in Sydney; employment was found for about 6,500 of these, mainly in country districts. The late strike at the Broken Hill Silver Mines has thrown large numbers of miners out of employment. With respect to Victoria, over 13,000 persons have registered themselves since last June at the government labour bureau in Melbourne as unemployed. The great bulk of the applicants were labourers, and, among mechanics, carpenters and painters appear to have suffered the most. In South Australia almost the only demand last quarter was for ploughmen, shearers, and general farm and station hands, of whom, however, there was a plentiful local supply. In Queensland the re-introduction of the Pacific Islanders to work on the sugar plantations, has given an impetus to sugar growing at Bundaberg and elsewhere, but work generally is slack, and there is no demand for fresh hands. In Western Australia, farm labourers, men in the building trades, navvies, general labourers

FIG. 15.—HYPOESTES MOSCHATA.

and miners have been well employed. In Tasmania the mining industry at Zeehan has been much depressed; owing to the bad times the government has reduced expenditure on public works, and has introduced proposals for increased taxation. In New Zealand, the main feature during the last few months has been the continued demand for public land, which has been taken up for the most part on the perpetual lease system by large numbers of settlers. Cape Colony and Natal offer reduced passages to mechanics, female servants, and others, for whom there is a limited demand in parts. In all the above-mentioned colonies there is a demand for small capitalists, farmers, fruit-growers, and female servants. As the Brazilian government are endeavouring to introduce European labourers into some of the tropical provinces of Brazil, it becomes necessary to repeat again most strongly the warnings which have been frequently issued from this office against British emigration to that country. The heat of the climate, the strangeness of food and language, the low rate of wages, and the conditions of life generally, which a British farm hand or mechanic must put up with in Brazil, are such as to make that country quite unsuited to him.

HYPOESTES MOSCHATA.

FROM material supplied to us by Baron Sir Ferdinand von Mueller, we are now able to give an illustration (fig. 15) of a plant which is likely to be of importance as a perfume-producing plant. It is an Acanthaceous plant, native to Arnhem's Land, North Australia, and is described by Sir Ferdinand as a perennial herb, pervaded by singularly penetrating musk scent, so that from the foliage a powerful cosmetic [perfume] can be distilled, the odorous principle not being subject to chemical decomposition through gentle heat, see *Select Extra Tropical Plants*, 8th edition, 1891, p. 529. The dried specimens retain their powerful odour of musk. A few seeds furnished us by Sir Ferdinand have been distributed among the curious.

FLORISTS' FLOWERS.

THE GARDEN ANEMONE.

WE were planting out our Anemones the other day, and I thought what a pity it is that these beautiful garden flowers are not more cultivated than they are. They do not require a great deal of attention to grow them well, and when they are in full beauty in the spring everyone admires them; when the flowers open in the early morning, there are no more beautiful sights than a bed of double Anemones in full bloom. The tubers are cheap enough now. In my early gardening days they were 1*s.* each, or 10*s.* 6*d.* per dozen. Now a hundred of the very best named varieties can be obtained for that money. A bed of beautiful flowers for half-a-guinea is within the reach of every admirer of the flower-garden. Those who like rich, bright colours, can have the scarlet-crimson and rich purple varieties, and there is no lack of the softer tints—rose, pale rose, blush, and white, striped and edged with other colours. One would think to look at the tuber of an Anemone, or even the plant itself in bloom, that it could not require a very wide or deep run for its roots, but I find that the Anemone does best in a deep and rich soil. At one time I fancied that the old florists took quite unnecessary pains with the formation of their beds for florists' flowers, but when I have seen the difference between the bloom of Anemones planted in ordinary garden soil and in a prepared bed after the style of the old florists, I have been compelled to modify this view of the matter. A writer in one of the garden periodicals about sixty years since, evidently an ardent florist says:—"It is astonishing that the garden Anemone is not more generally grown, as its culture is easy, and it invariably repays us with a profusion of bloom." We admit the "profusion of bloom," but it was obtained in this wise, and I would here add that this style of preparing the ground was recommended for all the "florists' flowers," as well as Anemones, such as the Pink, Pansy, Ranunculus, Tulip, Carnation, &c. "About the last week in September, take out the natural soil of the bed to the depth of 18 inches, in the bottom spread a layer of cow-dung, 3 or 4 inches thick, then fill up the bed to within 1½ inch of the surface,

with the following compost:—take of thoroughly rotted cow or horse manure, leaf-mould, and heavy loam, of each six barrowfuls, white pit-sand two barrowfuls, mix well together," &c. With this the hole of 18 inches deep was filled; the quantity of manure was too great, if it had not been turned over and over again until nearly all the nutriment had been washed or dried out of it, for they did not care to use the manure until it was at least twelvemonths old. This is the only way we can account for their using it in such large quantities without poisoning the ground, and killing some of their flowers outright. The man was right in recommending the loam to be heavy; both Anemones and Ranunculus require, or at least they do best when the loam is heavy; but it must be made porous by the use of decayed manure and leaf-mould. I have great success with the Anemone by planting the tubers in a border prepared for Vines, and which contains near the surface an unusually large quantity of manure; and in no other part of the garden have the plants ever grown so well or flowered so freely. The tubers are planted in January, and as the ground is well-drained, and has a southern aspect, they start into growth at once. This season they were planted early in December. They may be planted at any time between the end of October and the end of January. Like the Ranunculus, they do not like to be allowed to become dry at the roots when in full growth, and I mulch the beds with decayed manure, and afford water freely in dry weather. As soon as the leaves become yellow, the tubers are lifted, as if left longer than that in the ground, they start to grow again, which is injurious to them. I find if they are left alone in the ground, they will flower in the autumn, and some persons say that they can be established in the open air to grow and flower annually. This they will not do in any garden I have had charge of. They will flower in the spring and again in the autumn the first year after planting, but the second year there are many blanks, and the third year they decline further, gradually ceasing to flower, and at length they disappear. It is easy to save seeds, at least from the semi-double varieties. This should be sown in boxes in the spring, and placed on a hot-bed to vegetate. The young plants should be pricked out about 3 inches apart, they will form tubers which will produce strong flowering plants the following season. *Jas. Douglas.*

HOME CORRESPONDENCE.

MUSCAT CHAMPION GRAPE.—It is many years since I saw exhibited the Muscat Champion Grape. By reason of the large and handsome berries and the fine flavour which it has, great hopes were entertained that it would be a leading variety. I was not aware, however, till I read in the issue of the *Gardeners' Chronicle* of January 7, that the variety was raised by Mr. Meredith. I was at one time very intimate with him, but never heard him speak of Muscat Champion—and in his splendid exhibits of Grapes at Edinburgh, London, and elsewhere, I do not remember ever seeing this fine variety. The first time I ever saw it was in a first prize collection of sixteen kinds of fruit at the first horticultural International Exhibition held in Edinburgh. Four small bunches with large brownish berries composed one of the dishes, and so influenced the decision of the judges, that they awarded the first prize to the collection, and the recipient was the late Mr. Melville, then gardener at Dalmeny Park, near Edinburgh, who was credited with the raising of this (then) new Grape. I remember the circumstance well, by reason of Mr. Melville's success, causing me, along with others, to become a disappointed exhibitor in the same class. This Grape was again shown in Edinburgh by a prominent exhibitor of that time, Mr. Carmichael, then gardener at Sandringham, who told me that this delicious Grape was a great favourite with the Prince of Wales. I have grown it more or less ever since I first became acquainted with its merits (my success, however, is barely worthy of imitation), and all whom I have asked to partake of it speak in the highest terms of its flavour. Mr. Carmichael, replying to some of my questions, naïvely said, "Why should we wish all Grapes to be confined to blacks and whites?" Those referred to were more crimson than brown. I wish our good friend, "Vagabond," would kindly get a little more information for readers. I believe Messrs. Veitch sent it out. *M. Temple, Carron House.*

[Our correspondent, "Vagabond," corrected his mis-statement in our last week's issue. ED.]

ASPARAGUS FOR FORCING.—Many trade growers of Asparagus roots for forcing have mistaken notions as to what forcing Asparagus should be, and before they advertise their "excellent forcing roots," it would be well for themselves and purchasers if these vendors would make themselves acquainted with the properties of "Asparagus for forcing," much disappointment would then be saved to both parties. It appears that some growers believe that large-spreading roots (probably a dozen in one clump) is what the forcing gardener requires. Such are useless without strong, prominent crowns. The roots should be cultivated singly, and plenty of space allowed between them, to allow of strong growth. A daily dish of Asparagus is a welcome vegetable from November onwards, and those who may have been long accustomed to partake of it are disappointed when it is not forthcoming. The writer at one time had about 2 acres to choose forcing roots from, and could get produce easily and as plentifully as one could desire from the open ground; but now we find one can only depend on old-established firms to supply roots which produce crowns worth the trouble of forcing. *T.*

PRICES OF HOME-GROWN TIMBER.—Speaking generally, it may be said that the prices of home-grown timber have slightly improved during the past twelve months, but there is still much room for further advances. When we contrast the prices that are now obtained for forest produce generally with those realised fifty years ago, we cannot help feeling disheartened, for in many instances the selling price at present is hardly one-fourth of what it was in years gone by. Take as familiar examples, the prices of Oak timber, Oak bark, coppice wood, and charcoal as at present realised, and compare them with the prevailing prices of not much more than thirty years back, and the results would hardly be credited. When we think of the £20 per acre that was the ruling price of coppice wood when Hop culture was extensively engaged in, in many of the southern English counties; the 5*s.* or 6*s.* per foot that could readily be got for Oak timber, when wooden vessels were the order of the day, and when smelting iron was engaged in to such an extent that the famous weald of Kent was almost destroyed by the rage for Oak wood for the furnaces; and the £20 per ton for Oak bark that was paid in London not so many years ago, we cannot but reflect on the changes that a few years have brought about. Nowadays the forester is well contented with from £4 to £5 per ton for his brightest and best dried bark, with from £5 to £6 per acre for his coppice wood; and thinks the bargain especially good if he can procure 2*s.* per foot for his Oak timber. Faggots that used to fetch nearly 20*s.* per 100, are now a drug in the market at from 10*s.* to 15*s.* per 100; and small faggots, "pimps," as they are termed in England, only realise about 2*s.* or 2*s.* 6*d.* per 100. A large maker of these faggots, and who has supplied the Government with vast numbers, told me the other day that for 100 faggots he now sold, formerly 300 would find purchasers, and that the small bundles of split wood now sold at many shops were slowly but surely ousting the faggot from the market. In southern England, it may be truly said that in regard to the prices of home-grown forest produce, a few years have brought about marked changes. When Hop-growing was extensively engaged in throughout southern England, coppice-wood, if of suitable size for Hop-poles, was readily disposed of, and at very remunerative prices; but now, with the decline of that crop, the coppice plantation is fast being grubbed out to make room for the more remunerative Strawberry. Creosoting poles, and which lengthens their life by fully one-half, has also had a share in lessening the demand for poles and posts. But to return to the current prices of timber around London, it may be said that these have been fairly well maintained throughout the past year, and the demand is rather more encouraging than heretofore. Oak still finds a ready market at prices ranging from 1*s.* 6*d.* to 2*s.* 6*d.* per foot, the latter for exceptionally good logs of large size, clean, and free from shake. Elm cannot be sold to advantage, the average price of about 8*d.* being indeed discouraging. For Ash, if clean and well grown, from 1*s.* 6*d.* to 1*s.* 8*d.* can readily be got, but local demand affects the price considerably. Sycamore at 1*s.* 8*d.* or 2*s.* per foot is well sold, but the price of this timber varies widely with the locality. For Birch and Alder about 10*d.* per foot is usually offered; and Lime, Horse-Chestnut, and Beech will not at present realise more than about 7*d.* per foot. Amongst Pine-wood, Larch is the only kind that can be said to have a ready market in this country, the usual price of 1*s.* 3*d.* to 1*s.* 6*d.* per foot being well maintained. Scotch, Austrian, and Corsican Pines are not readily got rid of even at the modest price of 7*d.* per foot. Large faggots, for converting into those of smaller size for fire-lighting, are about 12*s.* per hundred; small faggots, 2*s.* 6*d.* per hundred; and firewood, 5*s.* per single horse cart-load. *A. D. W.*

VINE DRESSING AND PETROLEUM.—It is a "far cry" to Cupar, but I dare say a few words from me will reach your correspondent. Petroleum oil is at all times dangerous to use as a wash. I have heard gardeners boast of their success in applying it, but ultimately they have had to confess to misadventure, as so much depends on the degree of care with which is is used. If petroleum be mixed with clay, soft soap, and flowers-of-sulphur, into the consistency of paint, it can be safely applied with a brush, and neither red-spider, thrips, mealy-bug, nor Vine-scale will re-appear, if there be no greenhouse or stove plants in the vinery to serve as a nursery for such insect pests. Red-spider is often induced by keeping the inside border too dry, and the Vines insufficiently nourished. Heavy cropping, and anything else that weakens the Vine, also invites red-spider. If the leaves are too near the glass roof, and that is imperfectly ventilated, red-spider will often appear. Syringing the Vines after the appearance of the young bunches is likely to produce attenuated foliage, liable to scalding, which is often followed by red-spider, instead of leathery leaves of dark green colour, such as should result from proper treatment. Red-spider is another name for bad cultivation. *W. R., Streatham Hill.*

—— Seeing in the last issue of the *Gardeners' Chronicle* Mr. Williamson's experience with petroleum on Vines, I should also like to relate a similar experience that happened at a place in which I was living in Dorchester a few years ago. We had some red-spider lurking about the Vines, and I was instructed to wash them with a wineglassful of petroleum in one gallon of water, and a small quantity of soap only. Two Vines were washed with this mixture the day we mixed it, the rest being finished the next day with the mixture that was left from the previous day, the house being shut up for forcing the Vines soon afterwards. The two Vines that were washed first never broke, being dead down to the ground, but the others broke, although very weakly. There is no doubt that more of the Vines would have been killed had they been washed the first day. We came to the conclusion the strength had left the petroleum by the next day, as it had been kept constantly mixed by an assistant, who used a syringe for the purpose. *A. Gooden, Shopwyke House.*

CANCER AND TOMATOS.—Not long since quite a scare was produced amongst some of the consumers of the popular Tomato, that those partaking of it were liable to that dread disease, cancer! It will be re-assuring, therefore, to such to be informed, on the authority of Dr. Marsden, Chairman of the Medical Committee, the Cancer Hospital, Brompton, that:—"Tomatos neither predispose to, nor excite cancer formation, and they are not injurious to those suffering from this disease; but, on the contrary, are a very wholesome article of diet, particularly so if cooked." *J. B.*

GLADIOLUS CHILDSII.—I have received numerous enquiries relative to an advertisement which has recently appeared in the English papers, offering corms of a Gladiolus under the above name, and mentioning me as having spoken highly of this plant. Permit me to state that I know nothing of G. Childsii beyond what the advertiser tells us. The plants I wrote about in the American *Garden and Forest* in September, 1890, were six seedlings which were obtained from Messrs. Hallock & Son, New York, and which flowered at Kew in 1890. It is, of course, possible that Mr. J. L. Childs, the advertiser, has become possessed of the stock from which the Kew plants came, and which were originally the property of Herr Max Leichtlin, who raised them about ten years ago from G Saundersii, crossed with some of the G. gandavensis kinds; but I repeat, I know nothing of the qualities of G. Childsii. *W. Watson.*

THE YEAR'S RAINFALL.—The total rainfall for the year 1892, just ended, according to the rain-gauge of Sir J. B. Lawes, at Rothamsted, which is of one-thousandth acre area, and stands 420 feet above the sea-level, amounts to about 25¼ inches; this is 3¾ inches, or 354 tons of water per acre less than the average for the previous thirty-nine years, 1853-1891. The months of January, February, March, April, May, September, November and December each gave a deficiency of rain, while June, July, August, and October recorded an excess of rain. Thus, during the period of active plant-growth of our crops, there was a deficiency of moisture in the soil; while during the hay, grain, and Potato harvests, the soil was in a saturated condition. However, although these periods could not be called uniformly unpropitious, neither could they be called uniformly favourable. *J. J. Willis, Harpenden.*

NURSERY NOTES.

MESSRS. HUGH LOW AND CO.

Although, perhaps, this is not quite the best time to make a visit to these nurseries, where so many Orchids are always in stock, few of which cheer the month of January with their bloom, yet the immense quantities of Palms, and the unique collection of hard-wooded greenhouse plants, cannot fail to interest the visitor even at this period. At Clapton and at Enfield, the houses are very extensive, and cover some 325,000 superficial feet, and not a square foot of this area is allowed to stand idle—from which fact a stranger to this part of London will be able to form some idea of the quantity of plants in stock. The firm's principal dealings are with the trade, especially in regard to the Palm and to the stove and greenhouse department; but on the other hand, the trade in Orchids is, perhaps, greater in retail than in wholesale. A wonderful stock and collection of Cypripediums are in fine health, and are perfectly clean. One house is filled entirely with C. bellatulum, where there must be many thousands. The C. niveum and Godefroyæ section, although not of easy management, are also looking well, and just one bloom of niveum and one of bellatulum relieved the quantity of foliage in the house devoted to plants of this section. The Phalænopsis, which fill two large houses, are in good health, and most of them are bearing flower-spikes; but here the fog has done mischief, and a great number of the buds have dropped therefrom. Amongst these we noticed a fine little plant of Cephalotus follicularis, but the Anæctochilus that used to be here in some little quantity, appears to have gone. The Cattleyas, of which there are large quantities of established and semi-established plants, are good; but there are no blooms worthy of note at this time, although a great quantity of them are now in sheath. The same also applies to the Lælias. The group of Angræcum sesquipedale, however, were carrying a good number of their curious white and very wax-like blooms, and a few blooms of Sophronitis grandiflora looked especially bright from the absence of those of other species. A nice group of Saccolabium bellinum had their prettily-marked flowers well developed. Dendrobiums in quantity appear well ripened, and are showing bud, D. Wardianum and D. formosum giganteum being already in bloom. Vanda Amesiana is carrying a fair quantity of blooms, but these are lacking colour, which will no doubt be due to the fogs, and consequent dark days. The plants, however, looked well, and so did also the group of V. Kimballiana. A large house of Odontoglossums, well established, but not yet flowered, promises good results. The vast quantities of Palms ought to be seen to be appreciated, for we cannot attempt to speak of their number without incurring the charge of exaggeration. The whole stock is quite clean, and is composed of first-rate saleable plants. The bulk of them are of kinds best suitable for the trade, such as Kentia Belmoreana, K. Canterburyana, and K. Fosteriana, Areca Baueri, A. sapida, A. lutescens, &c.; Cocos flexuosa and C. Weddeliana, Phœnix reclinata (in very large quantity), P. rupicola and P. Sanderiana, Geonoma gracilis, G. Seemanni and G. Schottiana, Latania borbonica (Livistona chinensis), Thrinax parviflora, Chamærops elegans, C. excelsa, and Corypha australis, whilst a few of the less popular kinds are also kept in stock. Some of the Kentias have been planted out in beds instead of being grown on in small pots, and, although this is only at present an experiment, the result appears to be that the plants assume their characteristic form much earlier, and if they can be potted-up without very much check, they will certainly be better specimens than those in pots. A large trade is done in Aralia Sieboldii (Fatsia japonica), and preparations are being made for increasing the already large stock. A general collection of Ferns are kept up in varieties of the most saleable sorts.

SCOTLAND.

DRYDEN BANK.

I came to visit Dryden Bank on account of a verse of Scott, which appealed to my vagabondish nature, describing the effect of the mysterious light that issued from Rosslyn Castle:—

"It glared on Rosslyn's castled rock,
It ruddied all the copsewood glen,
'Twas seen from Dryden's groves of Oak
And seen from caverned Hawthornden."

Setting out to tramp to these places in one day, I came to Dryden last of the three. The old Oak wood well repaid the long walk; but a large walled-in kitchen-garden contained no houses of any sort, although it was cropped with vegetables. There being nothing to see except the Oak wood in its snowy draping, I reached Polton Station a long time before the start of the Edinburgh train. This gave me time to ascend a steep hill to Dryden Bank, one of the first established Grape-growing establishments in the neighbourhood of Edinburgh. A house 160 feet long is devoted to Alicantes. The bunches were so thick, that looking down the house, no other colour than purple could be seen, although a great many bunches had been cut. The Vines have been cropped as heavily for nineteen years, and show no signs of decay; this is chiefly owing to new rods being constantly run up. A house of Gros Colmar of the same dimensions is just as much a sight as the Alicante-house. To convince me that Gros Colmar was a good flavoured Grape, Mr. Spence the gardener cut for me a large-berried bunch. I must confess that I have never eaten a more luscious Grape. All the earthy, musky flavour usually associated with this Grape was entirely absent. I gave some berries to a well-known judge, and he endorsed my opinion. It may be a matter of soil that makes the difference, but I think that the real cause is, perhaps, the entire absence of thrips and red-spider, and that the manure is taken from a source surcharged with ammonia. Mr. Spence, the gardener, who was with Mr. Thomson of Clovenfords, evidently understands all the *technique* of viticulture,

The grounds round the villa are formally laid out: on the west side are two terraced lawns; in the middle of the higher one is a conservatory and a flower garden divided into four squares. To the right is a bank of Yews, with Spruces and Scotch Firs behind. The lower terrace contains beds of Roses; and on the other side of the path is an arch formed of Irish Yews, and a majestic Plane tree, 14 feet in girth. A small lawn with a bed of fine varieties of Rhododendron slopes down to the north side, and above is another lawn, laid out as if it were a flower garden, with formally-planted Golden Hollies and Irish Yews.

From the house there is a lovely prospect over the valley of the Esk to wooded Hawthornden, with the dark misty Muirfoot hills in the far distance. The neighbouring view is Dryden Glen, on the far side, stretching away to the Oak woods of Dryden Mains. *Vagabond.*

LOW TEMPERATURE IN THE PRESENT MONTH.

After the coldest December experienced in this district (in the valley of the Rivers Forth and Carron), for twelve years, the frosts have not abated in severity, and the Scotch "curlers" have had enjoyment on the ice to their hearts' content. It is unusual for the temperature to be lower here than elsewhere; often from the south of Scotland and England we have reports of severe weather when we have no frost hereabouts—there were on the 5th inst. 16° of frost at 1 P.M.; at 3.30 P.M., 25°; at 4.30 P.M., 28°; at 5.30 P.M., 29°. These readings were taken from a thermometer 1½ foot above the ground level. A change came on in the evening, and at 7.30 P.M. the thermometer stood at 27°; and at 10.30 P.M., 17° was noted. By daylight on Friday morning the thermometer had risen to 14°. I expected to have seen the thermometer at zero for once in Scotland, but not so yet. I have frequently seen 32° of frost during nearly a quarter of a century's residence in south-east and west of England, and vegetation suffers more than in Scotland. It is premature to state what damage is done. *M. Temple, Carron House, N.B.*

SOCIETIES.

ROYAL HORTICULTURAL.

January 17.—In spite of the adverse character of the weather, the show on Tuesday last at the Drill Hall, James Street, Westminster, was bright, and well up to the average. A good display of Orchids, containing some very interesting specimens, a group of fine Cyclamens, some Chrysanthemums, and a group of exceptionally well-grown plants of Begonia Gloire de Sceaux, together with a large collection of Apples and Pears, rewarded those who were able to defy the almost prohibitory elements.

Floral Committee.

Present: W. C. Leach, Esq., in the chair; and Messrs. R. B. Lowe, J. Jennings, G. Stevens, G. Phippen, H. B. May, W. W. Mann, C. F. Bause, E. Molyneux, T. C. Dreury, R. Owens, H. Herbst, J. Laing, G. Paul, H. Turner, C. Noble, C. E. Shea, P. Barr, F. Ross, C. J. Salter, W. Furze, and T. Godfrey.

A group of magnificent plants of Begonia Gloire de Sceaux came from Ascott, Leighton Buzzard, the garden of Mr. Leopold de Rothschild (gr., Mr. J. Jennings). This is a really fine plant at this season, and as seen on Tuesday in pots of 5 or 6-inches, and standing about 18 inches high, with its velvety leaves and extreme floriferousness, it would be indeed difficult to beat as a decorative plant. This Begonia was awarded a First-class Certificate, and the group a Silver Banksian Medal. Mr. Jennings also exhibited a group of Tree Carnation Sir Henry Calcroft. The plants were well flowered, and the blooms, which are rosy-crimson, are of good size and form.

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, sent a plant of Pteris serrulata gigantea, which gained an Award of Merit; its habit seems very free in growth, and the fronds, as its name implies, are much larger than the type. A plant of P. reginæ and some plants of Carnation Winter Cheer came from the same nursery (Vote of Thanks).

Messrs. Hugh Low & Co., Clapton and Enfield, staged a fine group of Cyclamens in the different shades. The flowers were of good size and substance, and produced in quantity (Silver Flora Medal).

A pretty group composed of Dracæna Massangeana and D. Lindeni in 5 and 6-inch pots came from Messrs. Wm. Cutbush & Son, Highgate, London, N. (Bronze Banksian Medal).

Messrs. Shuttleworth & Co., Peckham Rye, and Fleet, Hants, sent a group of Narcissus, nicely in bloom, consisting of Henry Irving, Countess of Annesley, N. obvallaris, N. Ard Righ (Vote of Thanks). Also Grape Hyacinth (Muscari) azureum, and the extremely pretty Iris Bakeriana.

Messrs. Jas. Veitch & Sons, Chelsea, again sent a collection of blooms of Rhododendron javanico-jasminiflorum hybrids. Also Begonia Winter Gem, and a few plants of Primula floribunda, a very dwarf little plant, with yellow blossom, very delicate and pretty.

Mr. W. C. Leach, gr. to the Duke of Northumberland, at Albury Lodge, Reigate, sent a group of cut Chrysanthemums and Poinsettias, very effectively mixed with bronzy Mahonia leaves (Silver Banksian Medal).

Messrs. H. Cannell & Sons, Swanley, Kent, had a group of seedling Primulas, Cannell's Favourite and Crimson King, two good dark-coloured varieties, and Jane, a very large delicate flesh-coloured flower. The habit of all is good.

Some Chrysanthemums were staged by Mr. Robert Owen, Maidenhead, who obtained an Award of Merit for Mrs. E. D. Adams, a very large Japanese flower, petals wavy, and flesh coloured. This has been seen at many of the shows in the autumn. Also for New Year's Gift, an English seedling Japanese. The petals are very broad and the flower flat; colour white, but falling to pale lemon in centre. A most desirable variety. Mr. Owen also staged Mrs. Maria Bourne, an English seedling Japanese, pink coloured. Mrs. L. C. Maderia, American incurved; the flower was of good form, but petals narrow. Secretary Farson (American), a large Japanese incurved, but exhibiting poor centre. Princess Marie (English seedling): this is a Japanese Anemone, rather loose-looking, but good; colour pink. Bryden, Junior, was a rather thin-looking Japanese yellow; and A. J. Booker a dark rose-coloured Anemone, which, we think, will rank with the best of this section. Mr. Owen had also a few blossoms of Owen's Imperial strain of Primulas.

Orchid Committee.

Present: H. J. Veitch (chairman), W. M. Pollett, Hugh Low, W. Bond, H. Williams, E. Hill, J. Jaques, M. T. Masters, J. Douglas, A. M. Smee, A. Sander.

It was a surprise to many to see such a good display on so unfavourable an occasion. This consisted for the greater part of Hybrid Cypripediums, whose numbers appear to be legion.

First-class Certificates were awarded to the following varieties:—To Calanthe gigas (C. Sanderiana gigantea × vestita gigantea). This is a truly magnificent hybrid, being one of the finest shown for a long time. The plant bore one spike, erect in growth, and about 4 feet in length from its juncture with the bulb, quite another foot of the terminal part of the spike being undeveloped. The flowers are of large size, the sepals and petals broad, the ground colour white, suffused with a rosy shading; the lip deep rose, with crimson base. The bulbs take much after its last-named parent, whilst the foliage was beautiful and fresh. From Messrs. J. Veitch & Sons. To Cypripedium Penelaus (C. caudatum Lindeni × C. calurum), a remarkably fine and distinct hybrid, the colour of the flowers deeper than in C. calurum, but possessing much of its character, the petals being, however, much longer (about 6 inches), also twisted; the younger flower was a deep rosy-pink, the older one paler; the habit vigorous. Also from Messrs. J. Veitch & Sons. To Cycnoches pentadactylon (see fig. 16, and *Gardeners' Chronicle*, p. 188, August 17, 1889, where a full description of this singular and beautiful Orchid is given by R. A. Rolfe). The variety certificated on this occasion is the male form, but as shown, the flowers are lighter, not so heavily barred or blotched with chocolate; the ground colour a yellowish-white; the lip and column are comparatively insignificant, although interesting in their construction. The plant shown bore three young growths, one of which carried five spikes, each a foot or more in length, and nearly fully developed; the other growths had each two spikes not yet open. Unlike a Catasetum, this Cycnoches produces its spikes on the top of the bulb-like growth, whereas in the other case they usually issue forth from the base with the young growth. The plant was shown by W. W. Mann, Esq., Ravenswood, Bexley (gr., Mr. Simmon).

Botanical Certificates were awarded to Bulbophyllum (comosum), a species not particularly remarkable for its beauty, although interesting. From the Royal Botanic Gardens, Glasnevin. To Cynorchis grandiflora, in which the deep lilac lip is the chief feature, the sepals and petals insignificant, from Messrs. Lewis & Co., Southgate.

A few small but good groups were shown, the best being that from Messrs. B. S. Williams & Son, to which a Silver Banksian Medal was awarded, the chief features being the Cypripediums, of which the best were C. insigne punctatum violaceum, a fine form; C. Leeanum and the variety called superbum, both in good condition; C. politum, a dark variety; C. amandum, C. Sallieri, C. calurum, C. Pitcherianum, Williams' variety, a fine dark form; C. nitens, beautiful; and C. cardinale. Others consisted of an Odontoglossum Alexandræ, with a branching spike—a good variety; O. elegans, bearing a long spike of small brownish flowers; and Lælia anceps Stella, a pure white form, the lip being slightly marked—a handsome variety.

Messrs. H. Low & Co. staged a beautiful little group of Saccolabium bellinum, the small but healthy plants bearing very fine flowers on short spikes.

Messrs. Sander & Co. staged a few new and choice varieties, amongst which were Cypripedium nitens, St. Albans variety (insigne Chantinii × C. villosum), a very beautiful hybrid, possessing more of the characteristics of its first-named parent; Pleurothallis ornatus, Sarcopodium Godseffianum, with rich golden-yellow flowers spotted with a darker shade, and Masdevallia Hincksiana of a chrome yellow colour.

Messrs. J. Veitch & Sons had also several more hybrid Cypripediums, of which note should be specially made of C. Orion (C. concolor × C. insigne), a distinct cross, the foliage and form of the flower after C. concolor, with more of the colour of C. insigne, but paler; C. Æson (C. Druryianum × C. insigne), which shows most markedly the relations to the last-named; C. Lathamianum (C. villosum × C. Spicerianum), previously shown, a very superior and noble-looking hybrid, in finer condition than when Certificated; C. Creon (C. œnanthum superbum × C. Harrisianum superbum), the flowers of which are intensely dark, of a claret shade, and C. Godseffianum (C. villosum Boxallæ × C. hirsutissimum). Phalænopsis Vesta (rosea leucaspis × Aphrodite), with small but bright rosy flowers. Another remarkable hybrid was Phajo-Calanthe Sedeniana albiflora (Phaius grandiflorus × Calanthe vestita rubra occulata), the flowers white like a Calanthe, but the bulb had more traces of its other parentage.

FIG. 16.—MALE FLOWER OF CYCYOCHES PENTADACTYLON.

Awards of Merit were voted to the following hybrid Cypripediums: To C. Germinyanum (C. hirsutissimum × C. villosum), a very distinct cross; the dorsal sepal rather narrow and erect, of the same colour, but darker than in C. villosum; the petals a deep mauve, showing its other parentage—a handsome hybrid. To C. Phœdra (C. Lindleyanum × C. Sedeni candidulum), a fine hybrid, much after the last-named parent, but with broader petals, whilst the colouring is much brighter throughout the flower, the growth very free. From Messrs. J. Veitch & Sons.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. G. Bunyard, W. Wilks, Harrison Weir, A. Veitch, G. W. Cummins, J. Cheal, T. J. Saltmarsh, J. Wright, A. Dean, E. Burrell, A. H. Pearson, J. A. Laing, G. Reynolds, G. H. Sage, G. Wythes, J. Hudson, C. Ross, F. Q. Lane, H. Balderson, G. Norman.

The exhibits under this committee consisted almost exclusively of Apples and Pears. Apple Blue Pearmain was the only one gaining an Award of Merit, and was from the Gardens of the Royal Horticultural Society at Chiswick. It is a fruit with a beautiful coat of bloom in the summer.

Messrs. J. Cheal & Sons, Crawley, exhibited some dishes of Apples, described as being new or but little known. The names were:—Egg or Paradise, a pretty little fruit; Swedish Reinette, Chas. Cognée, Cornish Aromatic, Galloway, Nanny, Beauty of Barnock, Egremont Russet, Hormead's Pearmain, Northern Spy, Ottershaw Pippin, Warner's Seedling, Forfar Pippin, Sandringham, Niton House, Bismarck, Newton Wonder, Histon Favourite, Landsberger Reinette, Calville Rouge, and Gospatrick (Bronze Banksian Medal).

A good dish of Apples, Annie Elizabeth, was sent by Mr. Turton, gr. at Maiden Erlegh (Vote of Thanks).

Mr. Charles Herrin, Dropmore, Maidenhead, had fifteen dishes of Apples, the best of which were Cox's Pomona, Cox's Orange Pippin, Lord Derby, Bismarck, Beauty of Kent, Adams' Pearmain, and Tower of Glamis.

Some seedling Apples were sent from Mr. H. Becker, Jersey, but none of them found favour; indeed, they were scarcely in a presentable condition. Dishes of Apples, Stamford Pippin and Winter Peach, came from Mr. Robert Mayer, The Gardens, Tattenden Court.

Messrs. G. Bunyard & Co., Maidstone, sent a collection of excellent fruits of Apples, consisting of 150 varieties, and a few Pears. The most noticeable were Golden Noble, Gascoyne's Scarlet Seedling, Forge Pippin, Warner's King, Peasgood's Nonsuch, Lady Henniker, Emperor Alexander, The Queen, Brabant Bellefleur, Wealthy, Sandringham, Lane's Prince Albert, Gloria Mundi, Bramley's Seedling, Schoolmaster, Melon Apple, Hoary Morning, White Gravenstein, Mère de Ménage, Ribston Pippin, Lord Derby, Bismarck (unusually fine), Beauty of Kent, Waltham Abbey Seedling, Queen Caroline, Hereford Beefing, and Purple Germain. There were three Pears—Verulam, Catillac, and Uvedale's St. Germain (Silver-gilt Knightian Medal).

EXAMINATION IN HORTICULTURE.

The Council of the Royal Horticultural Society sympathising with the efforts of the various County Councils, technical institutes, schools, gardeners' mutual improvement societies, and others bodies, to promote instruction in practical horticulture by means of lectures, demonstrations, &c., and in the hope of rendering such teaching more definite and effective, have consented to hold an examination in horticulture in the first week of May, 1893.

The following is an outline syllabus, showing the nature of the subjects to which it is considered desirable that the attention of students should be drawn.

ELEMENTARY PRINCIPLES,

On which Horticultural Practice is based.

1. Soils, good and bad: their nature and composition; weeds and their indications.
2. Requirements of growth—water, heat, air.
3. Seeds: nature of, duration of vitality in, and modes of germination.
4. Roots, nature and functions of; fibrils and root-hairs; what they do, and how they do it—what helps and what hinders them.
5. Stems and branches: their nature, work, and uses; helps and hindrances to their work.
6. Leaves: what they are, what they do; helps and hindrances to their work.
7. Tubers and bulbs, leaf buds and flower buds.
8. Growth and development: increase in size and changes of composition and structure; formation and storage of food materials.
9. Flowers: their component parts; what they do; artificial fertilisation.
10. Fruit: changes and development during ripening; forms and varieties, as, e.g., Apple, Strawberry, Plum, &c.
11. Seed: formation of.
12. Variation and selection.
13. Names and orders of common garden plants, trees, &c.

HORTICULTURAL OPERATIONS AND PRACTICE.

1. Surveying and landscape gardening: elements of.
2. Choice of site for garden.
3. Description and use of implements under each head.
4. Operations connected with the cultivation of the land, with explanations and illustrations of good and bad methods: digging and trenching; draining; hoeing, stirring the soil, and weeding; watering; preparation of seed bed; rolling and raking; sowing, transplanting, and thinning, potting, planting; aspects, positions, and shelter; staking; earthing and blanching, &c.
5. Propagation. Elementary principles: cuttings. Budding and grafting, stocks used. Layering. Division. Branch pruning. Root pruning: old and young trees and bushes. Training.
6. Fruit culture: open air and under glass; small fruits; Apples and Pears; stone fruits; gathering and storing; packing and marketing. General knowledge of fruits, and selection of varieties.

7. Vegetable culture: tubers and roots; green vegetables; fruits and seeds; rotation of crops, and selection of varieties.

8. Flower culture: outside and under glass.

9. Manures, and their application.

10. Improvement of plants by cross-breeding, hybridisation, and selection.

11. Arboriculture: trees and shrubs, and their culture.

12. Insect and fungus pests: prevention and treatment.

Lecturers and teachers wishing their students to sit for the examination would do well to send to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster, two copies of the syllabus on which their lectures have been based.

Students and young gardeners not having had the advantage of attending lectures, but wishing to present themselves at some one of the centres for examination, would do well to communicate with the Secretary of the society; and they might with advantage consult some of the following works:—*Primer of Botany* (MacMillan & Co.), by Sir J. D. Hooker, K.C.S.I.; *Botany for Beginners* and *Plant Life* (Bradbury, Agnew & Co.), by M. T. Masters, M.D., F.R.S.; *Popular Gardening*, 4 Vols. (Cassell & Co.), edited by D. T. Fish; *Epitome of Gardening* (Adam Black & Co.), by T. Moore and M. T. Masters; *Agriculture*, Parts I. and II. (John Murray), by W. Fream, LL.D.

Two sets of questions will be set; one of an elementary character called the Lower Grade, and one more advanced called the Higher Grade. The Royal Horticultural Society will award a Silver-gilt Medal to the candidate gaining the highest number of marks in the first class in the higher grade, and a Silver Medal to the highest in the first class in the lower grade, and will grant Certificates of the class in which candidates shall have passed. Persons wishing to sit for the examination must send in their name and address to the Secretary, R. H. S., 117, Victoria Street, Westminster, not later than the first week in April, when they will be informed of the nearest centre at which an examination will be held. A small capitation fee will be charged for every student in order to partially defray the expenses of the examination.

SCHOLARSHIPS.

Since the above was in print two scholarships have been offered, viz., one by the Worshipful Company of Gardeners, and the other by the President of the Royal Horticultural Society, Sir Trevor Lawrence, Bart., and it is hoped that before the date of the examination others may be added. [A third offered by Baron Sir Henry Schroder has been since announced. ED.]

These scholarships will each be of the value of £26 a year for two years, and will be awarded after the examination to the two students who shall pass the highest, if they are willing to accept the conditions which will be attached. These conditions have yet to be exactly formulated, but the main outline will be, that the holder must be between the ages of 18 and 22 years, and that he shall study gardening for one year, at least, at the Royal Horticultural Society's gardens at Chiswick, and for the second year, either there or at some other place to be approved.

NOTICES OF BOOKS.

DAS KLEINE HAUS MIT GARTEN. Ninety-two pages, small quarto. By Lothar Abel. (A. Hartleben, Bookseller, Vienna, Pesth, and Leipzig.)

This well-written little *brochure* contains, as the author himself says in his preliminary remarks, practical hints on building country houses, villas, and cottages; and he seems to have said all that is essential to be known of the subject by owner and builder alike, beginning with the choice of site, aspect, soil, and water.

The housing question, as he pertinently remarks, and in particular that which concerns the so-called working-classes, is in direct connection with educational progress and the conditions of civilisation in a country, and is of special importance in the development of large towns. Quoting Dr. Lette, he remarks that a suitable habitation is the foundation of the well-being of the family, and the primary condition for civilisation and humanity, an orderly family life, and the bodily and intellectual healthy rearing of the young.

In the Austrian-Hungarian Empire, the conditions under which the peasantry and working-classes live reveal much that requires amendment. The almost constant state of war which prevailed for hundreds of years brought about a condition of things that has, with a few exceptions, lasted till our day. The uncertainty of life and property compelled the folk to live in fortified towns, or in large villages, consisting of ground-floor dwellings. And to-day there are thousands of the latter scattered over the empire, which are largely peopled with the bauernfolk—the farmers—mostly freeholders. Of course, the homesteads, with their manure-heaps, offal, the immense numbers of geese and turkeys, goats and pigs, the milch-cows, oxen and horses, are crowded together in these, much to the disadvantage of all concerned. The goats, pigs, geese, the cows, oxen, horses, have their separate herds, who collect and drive them out every day during spring, summer and early autumn, and at the end of the day brings them home again from the common grazing-ground. To do away with these congeries of farm-houses which are in constant danger from fire, and to place the houses on, or near the land belonging to each, would be a clear gain to farmer and animal alike, and although M. Abel in this booklet has made a beginning with the artizan class, his system if it take with his countrymen cannot stop there, but must include the farmer. In his choice of soil on which to build, he favours a dryish clay in preference to gravel, which is the favourite substratum in these islands. He fears the exhalations from gravel, and it is true that a clayey soil will, in course of time, under a building become so dry that moisture from below cannot ascend, nor moisture from the sides penetrate it. He has taken for his models the cottages and smaller villas of this country, the selections including the simplest and the most ornate in style and surroundings. As becomes a garden architect he has given much attention to the garden, its formation, aspect, planting, and arrangement, not forgetting the beautiful in describing and cataloguing the useful—in truth, erring on the side of recommending too many pretty flowering plants and fine shrubs, but for that we may forgive him. In taking leave of the *brochure*, we can but deplore the want of so well-written and illustrated cheap work in our own language.

A GARDENER'S STORY.

A NEW book by an accomplished man, who possesses the additional merit of being an enthusiastic gardener, is always welcome. Gardening books are too often dull when they might easily be interesting, and prosaically heavy when, without being at all flippant, they ought to be at least entertaining. There should be nothing antagonistic between the art of gardening and the art of bookmaking, but unfortunately the two phases are rarely found happily associated. How comes it that really clever gardeners, men who are to a pronounced degree entertaining on almost every section of their art, are such sorry companions in their books? The question is a nice one, and the present writer is quite willing to leave it to others to answer. When one of the two famous women, whose lives the great Dean Swift may be said to have ruined by his callousness, was told of the pretty things which the author of *Gulliver's Travels* had written of her rival, she is reported to have exclaimed, with no little *pique*, "The Dean could write charmingly about a broomstick." More often than not the authors of gardening books appear to forget that they are dealing with the most fascinating of all subjects, and their works are too frequently as wildly uninteresting as Homer's list of ships. There are, of course, many exceptions—the late Shirley Hibberd was often exceptionally picturesque in treatment of matter-of-fact details; and the living Canon Hole is too much of a literary artist to lay himself open to the charge of dullness. But the books of these writers—with a few others that might be mentioned—only prove the truth of the general rule, that gardening books are read by the public as a duty rather than as a recreation—for the practical information which they contain rather than as a mental diversion. There is in very many instances no reason whatever for the isolation of these two attributes.

Among American authors who have attempted to convey practical instruction in an eminently readable and even fascinating manner, Mr. George H. Ellwanger—a partner in one of the best known American horticultural establishments—comes at the head. His delightful book, *The Garden Story*, led us to look forward with pleasurable anticipation to his next collection of essays, and *The Story of my House* has more than justified our expectations. In the United States this little handful of polished essays has gone into several editions, and the first English reprint of Messrs. Geo. Bell and Sons is all but in a second edition, as one would naturally expect from the exceptionally dainty way in which it has been placed before the public on this side of the water. *The Story of my House* is just what one would expect from Mr. Ellwanger, whose house and grounds, as every English visitor will be glad to testify, are in the most perfect good taste, and without the slightest trace of that ostentatious display which the stay-at-home Englishman is a trifle too ready to associate with the surroundings of rich Americans.

"These are but my fantasies," is the motto with which Mr. Ellwanger adopts from Montaigne; and the reader, after he has gone through the volume, will be strongly inclined to add an end-note also from a French source—this time from Molière—"Elle est petite si on le veut prendre par là; mais je l'appelle grande pour ce qu'elle contient," for it is essentially a little book brimful of good things. Mr. Ellwanger has evidently studied with excellent effect the essays of such classic writers as Charles Lamb, Leigh Hunt, William Hazlitt, and J. Russell Lowell at his best. Of the fourteen chapters of which the book is composed, those which have a more special interest to readers of this journal are "The Ideal Haven," "My Indoor Garden," "A Blue-Violet Salad," and "Footsteps of Spring." Each of these essays possesses the qualities which have rendered the "out-door" writings of Richard Jefferies and Thoreau so universally popular. The description of the indoor garden is perhaps the best of the four essays, for the failures and the triumphs which most people have, with Mr. Ellwanger, encountered in their counterfeit presentment of a "slice" from the tropics are hit off with consummate literary skill. Mr. Ellwanger's special weakness appears to be in the direction of his indoor bog garden, and his knowledge, both cultural and historical, of all aquatic plants, particularly of the Nymphæa, is very wide. His favourite is Nymphæa odorata, the white and sweet-scented cup of which "falls upon the sight like the tinkle of a woodland rill upon the ear, imparting its harmony to the mind, a thing to be carried away and perfume the memory." He has naturally something to say respecting the Lotus, and it will interest many readers to know that in Thibet at the present day the worship of the divinity of the Lotus is still the dominant religion, the daily and hourly prayer being, "*Om mani padme, haun*," which, being literally rendered, means, "O God! the jewel in the Lotus. Amen." Orchids also form an important section in Mr. Ellwanger's indoor garden, and it has always been a matter of surprise to us that such a beautiful class of plants is not more generally employed in this direction. The most suitable species are easily grown, and if the initial expense is greater than for many common plants, the results are not only infinitely greater, but, as a matter of fact, bear no comparison. Mr. Ellwanger confesses himself satisfied with fine specimens of a few of the easier grown and really beautiful species and varieties, and considers that "mere rarities or Orchidaceous curiosities are preferable in one's neighbour's garden." The fine plant of Cypripedium œnanthum, which his neighbour values at 1000 dols., is not worth his plant of Lælia anceps morada; and his Vandas are suggestive of a spice-box of the Orient.

But Mr. Ellwanger is not above growing certa in

common plants, without which, indeed, no indoor garden would be complete. Roses, as a matter of course, particularly Maréchal Niel and Gloire de Dijon, Cinerarias, Chinese Primulas, Cyclamens, and Violets (he confesses to a weakness for the Marie Louise variety, than which there is none better), not to mention Heliotrope, Daphnes, Stephanotis, Azaleas, Chrysanthemums, and the Tazetta varieties of Narcissus, all go to make up the furniture of his indoor garden; and if a man cannot get satisfaction out of this selection, the sooner he gives up indoor gardening the better alike for his temper and his pocket.

Apart from its distinct practical utility, *The Story of my House* is above all a reflective book, and one which may be dipped into at any time and under any conditions. The chapters dealing with *bric-à-brac*, and especially those in connection with books, fancifully entitled "Magicians of the Shelves," are of equal charm. Boileau has declared that a faultless sonnet is in itself worth a long poem; and of everyone of Mr. Ellwanger's essays it may be said, that it is worth very many big books.

COLONIAL NOTES.

ORCHID CULTIVATION IN HONG-KONG.

ALTHOUGH there are only about forty species of Orchids natives of Hong-Kong, there are many others which can be cultivated in the island with considerable success. Naturally, the conditions under which they are grown vary very much from the conditions under which Orchids are grown at home. No artificial heat or glass-house is required to protect them from the cold of winter, as the thermometer rarely falls below 45° F. Pot-plants, and those on rafts, are grown in skeleton-houses. The shading used is Bamboo, and is so made that whilst admitting sufficient light for the proper growth of the plants, it excludes the direct rays of the sun. Others, again, are grown on the trunks and branches of numerous umbrageous trees. No peat can be got, and the substitutes obtainable are very inferior. The best is Cocoa-nut husks, and these are chopped up for potting purposes into 1-inch cubes. These retain moisture well, and the roots of many Orchids penetrate them in all directions. Good fibrous loam would doubtless be better, but that, like the peat, is out of the question. Sphagnum can be obtained ftom Japan. Several of the Dendrobiums, amongst them D. superbum, D. macrophyllum, and D. Dalhousieanum, do remarkably well, and flower freely when potted in a mixture of Cocoa-nut husk, sphagnum, and charcoal. This compost also admirably suits all the Vanda tribe. Some plants of Vanda tricolor are now (November) in flower; they are about 3 feet high, and are furnished with fine healthy foliage to the base. Mexican and South American Orchids do not, as a rule, thrive here, but Oncidium flexuosum is an exception when treated in the same manner as the foregoing. Cypripediums, such as C. Stonei and C. Haynaldianum make good plants when grown in a mixture of Cocoa-nut husk, sphagnum, and Canton soil. This latter is nothing more nor less than Canton river mud, and it is used extensively in cultivating all kinds of plants in pots. When it is brought to Hong-Kong it is dry and hard, and before it can be used for plant-growing, it has to be cut up in much the same way as the Cocoanut husks. Its manurial value is unquestionably very great, for those plants which have a proportion of it in their compost are always vastly superior to those which have not. Calanthe veratrifolia makes quite a show when in flower, with scapes nearly 3 feet high; it is grown entirely in this mud. Others that do well in it are Calanthes vestita and Veitchii, and Cypripediums of the barbatum and niveum sections. Cypripedium purpuratum, a native of Hong-Kong, is in flower at the present season, and a charming little thing it is.

Amongst those that are grown on rafts with sphagnum may be mentioned Dendrobium Pierardi, D. aggregatum, which flowers in July, two or three months later than in England; D. densiflorum, Aërides odoratum, and A. quinquevulnerum. There are some dozens of plants of the latter, but the majority of them are grown in pots; they do equally well either way. When in flower, they are one of the principal attractions of the gardens.

Renanthera coccinea thrives and flowers in an astonishing way on the trunks and branches of Poinciana regia. Many of the shoots are of several years' growth, and are 10 and 15 feet in length, being covered with leaves nearly the whole distance. This is also cultivated in pots in the same compost as used for Cypripedium Stonei, but the plants are never allowed to get more than 4 feet high. They are kept within bounds by cutting off the lower ends of the shoots after the flowering period; it does not appear to hurt them much, as they lose very few leaves, and soon push out new roots in profusion, although they are grown in nearly full sun. The plants on the trees produce much larger panicles than those in pots, but on the other hand they are less numerous. It is a pity that this Renanthera is such a difficult thing to flower in England, as it is a truly grand Orchid. Dendrobium Loddigesii makes itself at home in Mango trees (Mangifera indica) as evidenced by the hundreds of flowers produced in the late spring or early summer; large patches of it 2 or 3 feet long by about as many broad, are simply one mass of bloom at that time. Amongst Phalænopsids, P. amabilis and P. Schilleriana stand out prominently as species that do well. They make large leathery leaves, and their long flat roots traverse the big aërial roots of Ficus retusa, on which they are grown in all directions. A little sphagnum is used in fixing them at first, but the roots soon get away from it, evidently preferring to be uncovered. Many other Orchids do far better on trees than anywhere else, particularly Cleisostoma Fordii, whose dagger-shaped inflorescence reminds one of Sarcanthus pugioniformis; Vanda concolor, with dull yellow flowers, and not by any means pleasing; Sarcanthus formosanus, with small yellow flowers, and Dendrobium aggregatum. These are all in the best of health on trees of Stillingia sebifera. During the summer months the heavy rainfalls do away, to a great extent, with the necessity for artificial watering. The average annual rainfall is about 90 inches. In June of this year, 24 inches fell in four days. Through the winter very little rain falls; in fact, it is quite the exception to get a shower—but this is rather a blessing than otherwise so far as Orchid growing is concerned, as most Orchids are the better for being kept dry at this time. Of course this refers to Orchid cultivation here. Very few insects attack this class of plants, and sponging on that account has rarely to be resorted to, and as to any dust deposited on their leaves it is washed off by the rains. *W. J. Tutcher.*

CHRYSANTHEMUMS IN THE COLONIES.

In a lately-received issue of your valuable journal, you, in tones of parental despondency, tell us—beginning, as a fond and fretful parent would, by saying that "it is no use telling us"—to devote our energies to the development of native flowers instead of "slavishly imitating European customs." Is not imitation the sincerest form of flattery, and is it wrong to flatter our dear old mother by doing as she does?

Really, instead of rebuking us, the boot is on the other leg. Example is better than precept; we should not rebuke for that would be very unbecoming, but we should ask why you encourage and reward yourselves for doing what you think is not good for your children. We have beautiful wild flowers here, and I would a thousand times rather wander over the veldt among the Afrikanders (Watsonias), search for Microlomas, trampling over Lobelias, Gazanias, &c., and see, as I saw a few weeks ago, a bed of crimson Satyriums, than go and see a house of "mums" where the plants are handsome (seldom), and the flowers gigantic, and tell the grower—we are often fussy fellows—that he's been feeding 'em up (I potted some in "good stuff," yesterday). In making so much of Chrysanthemums in England are you not "slavishly imitating" Japanese customs? But, seriously, it is with us, as with you, a question of supply and demand. In our autumn, as in yours, they are needed because other flowers are exhausted, and they brighten up a seedy season.

From what I have seen and heard of gardeners here, and nearly all who are interested in horticulture, native flowers receive due appreciation. *C. E. Butters, Port Elizabeth.* [We rejoice to hear it, and hope we shall have the means of appreciating them also. ED.]

INDIA.

OODEYPORE.

WE have received a copy of the annual report of the gardens of Her Highness the Maharana of Oodeypore, from which we extract the following passage:—

"Natives are extremely fond of flowers of all sorts more especially such as have a good strong smell like the Artabotrys odoratissimus, Lawsonia alba, all sorts of Jasminum, Gardenias, &c. Native ladies are very fond of decking their hair with the beautiful scarlet flowers of the Butea frondosa which is a gorgeous sight, when in flower all our jungles look like a blaze of fire. In some of our jungles, too, there are Bauhinias of sorts which come in flower at the same time as the Butea. The lilac flowers of the Bauhinias and scarlet flowers of the Buteas are very lovely. Lantana alba, Poinciana pulcherrima, growing side by side on our hills together with Gloriosa superba, make the natural blending of colour in this wild state truly grand. All our dripping ghauts are filled with such Ferns as Adiantum capillus-veneris, A. caudatum, Actiniopteris radiata, a handsome little silvery Fern Cheilanthes farinosa, also a very hardy Fern, Pteris longifolia, growing almost side by side. The Adiantum caudatum is such a pretty dwarf creeping Fern that no rockwork should be without it; it grows all the year round in a damp situation, so does the Actiniopteris radiata. This is such a pretty little Palm-like Fern and is to be found peeping out from the crevices of the rocks. Both of these die when grown in an exposed position during our hot season, and after the first shower send out their cheery little fronds again. I find it difficult to grow Ferns here during our hot weather. The long drought with such a dry atmosphere as we have got, is much against their successful cultivation. Crotons do not do well either; this class of plants like a saline atmosphere; which will account for their luxuriance along the coast."

LEE, LEWISHAM, AND BLACKHEATH HORTICULTURAL SOCIETY.—The above prosperous body held its twenty-sixth annual meeting on Monday the 16th inst., at the Institute, Lee, the Treasurer M. N. BUTTANSHAW, Esq., in the chair. At the next meeting, which will be held on the 27th inst., a paper will be read by Mr. G. GORDON, on "Insects Injurious to Garden Crops."

TYNEMOUTH FLORAL AND HORTICULTURAL SOCIETY.—The thirty-eighth annual meeting of this Society was held on Thursday in the Town Hall, Saville Street, North Shields, under the presidency of the Mayor. The annual report, read by Mr. ROBSON, the hon. secretary, congratulated the members upon the continued success of the Society, and stated that the last exhibition, held in the Tynemouth Aquarium, was the best that had ever taken place under its auspices. Thanks were tendered to the donors of special prizes, and also to several tradesmen and others for contributions to the prize funds. The financial statement submitted by Mr. J. R. MOFFETT, the hon. treasurer, showed a balance in favour of the Society of £41 10s. 3d. The reports were adopted, and the officers having been re-elected, the proceedings concluded.

Obituary.

MR. J. SHEPPARD, of The Gardens, Woolverstone Park, Ipswich, died, on the 16th inst., in his 60th year, from cancer of the stomach. It is less than a week since that we had a letter from him announcing his illness, and its probable termination, the speedy occurrence of which must, under the circumstances, be considered merciful. Mr. Sheppard had for many years been one of our most valued contributors, and the garden under his charge gave ample proof that he could put into practice the precepts he so well knew how to commit to paper. Mr. Sheppard had been for 36 years head-gardener at Woolverston.

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (—) the Mean for the week ending January 14.	Accumulated. Above 42°, for the Week.	Accumulated. Below 42°, for the Week.	Accumulated. The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending January 14, is furnished from the Meteorological Office:—

"The *weather* during this period was less cold than that of the preceding fortnight, and a gradual thaw was prevalent during the daytime in all parts of the kingdom. Rain, sleet or snow was experienced at times, and the sky as a whole was very cloudy and gloomy; in the extreme west and north, however, some fine bright intervals occurred.

"The *temperature* continued below the mean, but was much less low than during the previous week; the deficit ranged from 2° in 'Scotland, E. and England, N.E.,' to 5° in 'Scotland, N.,' 'England, S.,' and 'England, S.W.' The highest of the maxima were recorded on the 13th at most of the Scotch stations, and on the 14th over England and Ireland, and ranged from 53° in the 'Channel Islands,' to 47° or 48° in some of the western and northern districts, to 42° in 'England, N.E.' and the 'Midland Counties,' and to 41° in 'England, S.' The lowest of the minima were registered on rather irregular dates, and varied from 15° in 'Scotland, E.,' and 16° in 'Scotland, N.,' to between 22° and 28° in most other districts, and to 32° in the 'Channel Islands.'

"The *rainfall* just equalled the mean in 'England, S.,' but was less in all other districts; in 'Scotland, W.,' 'England, N.W.,' and the 'Midland Counties,' the fall was very slight.

"The *bright sunshine* exceeded the mean considerably in the north and west of Scotland, and slightly in the S.W. of England; elsewhere the amount recorded was very small. The percentage of the possible duration ranged from 29 in 'Scotland, N.,' and 28 in 'Scotland, W.,' to only 6 in 'England, N.E.' and the 'Channel Islands,' and to 3 in 'England, N.W.'"

MARKETS.

COVENT GARDEN, January 19.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

No alteration. Business very dull. *James Webber, Wholesale Apple Market.*

POTATOS.

The weather being more favourable, farmers are loading freely, and stock is increasing. Prices still continue firm. Best samples, 90*s.* to 100*s.*; ordinary kinds, 50*s.* to 55*s.* *J. B. Thomas.*

SEEDS.

LONDON: *Jan.* 18.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that, as might be expected, the general country trade for seed hangs fire. Extra fine home-grown English Cow-grass is inquired for. American Clover seed is now cheaper in London than on the other side of the Atlantic, to-day's cables being equivalent to 74*s.* per cwt., landed here. In Trefoil, a good business has been doing at full prices. White Clover seed is slow, but in Alsike a substantial advance has been established. Rye-grasses look like being very dear this season. Tares, owing to a falling off in the supplies, are firmer. More money is asked abroad for Haricot Beans. There is no change in Peas. Mustard and Rape seed keep steady. Hemp seed shows a considerable jump upwards. Canary seed is quiet, but no cheaper. For Windsor Beans there is a brisk inquiry.

FRUITS AND VEGETABLES.

SPITALFIELDS: *Jan.* 17. — Quotations:—English Onions, 7*s.* 6*d.* to 8*s.* 6*d.* per cwt.; Belgian and Dutch do., 5*s.* 6*d.* to 6*s.* per bag of 110 lb.; Spanish do., 6*s.* 6*d.* to 8*s.* 6*d.* per case. Prices otherwise without alteration from last week.

BOROUGH, *Jan.* 17.—Quotations:—Cabbages, 3*s.* to 3*s.* 6*d.*; Savoys, 4*s.* per tally; Cauliflowers, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen; Spinach, 1*s.* 6*d.* to 2*s.* per bushel; Sprouts, 1*s.* 6*d.* to 1*s.* 9*d.* per half-sieve; Carrots, 2*s.* 6*d.* to 3*s.*; Turnips, 1*s.* 6*d.*; Parsley, 4*s.* per dozen bunches; English Onions, 6*s.* to 8*s.*; Dutch do., 5*s.* to 6*s.* per cwt.; Horseradish, 1*s.* 6*d.* to 1*s.* 9*d.* per bundle.

STRATFORD, *Jan.* 18.—There has been a good supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Savoys, 2*s.* to 5*s.* per tally; Greens, 1*s.* to 1*s.* 9*d.* per bag; do., 2*s.* to 2*s.* 6*d.* per dozen bunches; Turnips, 2*s.* to 3*s.* do.; do., 40*s.* to 60*s.* per ton; Carrots, household, 40*s.* to 50*s.* do.; do., cattle-feeding, 34*s.* to 35*s.* do.; Parsnips, 1*s.* 3*d.* to 1*s.* 6*d.* per score; Mangolds, 17*s.* to 20*s.* per ton; Swedes, 20*s.* to 25*s.* do.; Onions, English, 160*s.* to 180*s.* do.; do., Dutch, 6*s.* 6*d.* to 7*s.* per bag; Apples, English, 5*s.* to 5*s.* 6*d.* per bushel; do., American, 10*s.* to 20*s.* per barrel; Brussels Sprouts, 1*s.* 6*d.* to 1*s.* 9*d.* per half-sieve; do., 2*s.* 6*d.* to 3*s.* per sieve; Celery, 9*d.* to 1*s.* 3*d.* per roll; Horse Radish, 1*s.* 9*d.* to 2*s.* per bundle; Scotch Kale, 1*s.* 3*d.* to 1*s.* 6*d.* per bushel.

FARRINGDON: *Jan.* 19.—Quotations:—Parsnips, 65*s.* to 70*s.*; Carrots, 50*s.* to 60*s.* per ton; Turnips, 50*s.* to 60*s.* per ton; Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; Savoys, 4*s.* to 5*s.* per tally; Celery, 12*s.* to 18*s.* per dozen; English Onions, 8*s.* to 9*s.* per cwt.; Horseradish, 2*s.* per bundle; American, Spies, Apples, 15*s.* per barrel; Baldwins, do., 15*s.* do.

POTATOS.

BOROUGH: *Jan.* 17.—Quotations:—English Magnums, 50*s.* to 65*s.*; Hebrons, 60*s.* to 70*s.*; Snowdrops, 60*s.* to 75*s.* per ton.

STRATFORD: *Jan.* 18.—Quotations:—Magnums, 50*s.* to 65*s.*; Imperators, 55*s.* to 70*s.*; Bruce Magnums, 60*s.* to 75*s.*; Scotch do., 60*s.* to 70*s.*; Main Crop, 70*s.* to 90*s.*; Belgian Magnums, 65*s.* to 70*s.* per ton.

FARRINGDON, *Jan.* 19. —Quotations:—Magnums, 60*s.* to 70*s.*; Hebrons, 80*s.* to 90*s.*; Abundance, 90*s.* to 100*s.*; Main Crop, 95*s.* to 100*s.*; Imperators, 60*s.* to 65*s.* per ton.

LONDON AVERAGES: *Jan.* 18.—Magnums, 55*s.* to 70*s.*; Hebrons, 70*s.* to 80*s.*; Snowdrops, 60*s.* to 80*s.*; Imperators, 60*s.* to 70*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending January 14, and for the corresponding period last year:—1893: Wheat, 26*s.* 4*d.*; Barley, 25*s.* 6*d.*; Oats, 16*s.* 11*d.* 1892: Wheat, 35*s.* 6*d.*; Barley, 29*s.* 3*d.*; Oats, 20*s.* 7*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 115*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 75*s.* to 112*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 28*s.* to 44*s.* per load.

NOTICES TO CORRESPONDENTS.

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of **75 per cent.**

Advertisers are reminded that the "Chronicle" circulates among ALL *classes of gardeners and garden-lovers at home and abroad, and is preserved for reference in all the principal Libraries.*

TO OUR READERS.—*The Editor begs leave to solicit from the readers and contributors to the Gardeners' Chronicle:—*

Short Practical Notes on Cultural Matters;

Early Intelligence of Local News likely to be of general interest;

Notes and Memoranda useful to the trade;

Specimens of New or Interesting Plants, Fruits, &c.;

Drawings or Photographs of Gardens, Trees, Flowers, &c., and which if suitable for reproduction will be utilised so far as possible.

ADDRESSES: *J. Atkinson, and Others.* The Gardeners Royal Benevolent Institution, Mr. Ingram, secretary, 50, Parliament Street, London, S.W.; United Horticultural Benefit and Provident Society, secretary Mr. W. Collins, 9, Martindale Road, Balham, S.W.

BOOKS: *G. K.* Thompson's *Gardeners' Assistant*, new edition. Price about £1 second-hand, or about £1 5*s.* of Blackie & Son, Edinburgh.—*Work on Table Decoration*: *Cretica.* We know of none better than that which you possess. Enquire of the Editor of *The Bazaar*, 170, Strand, W.C.

GRASSES: *Hexham.* You have not numbered your specimens. So far as we can see, they are Hordeum murinum, Aira cæspitosa, and Agrostis vulgaris.

HANGING BASKETS, PLANTS FOR: *G. K.* Ivy-leaved Pelargoniums, both double and single flowered; Petunias, single and double flowered; Tropæolum Lobbi, T. Ball of Fire, T. aduncum, Achimenes patens, A. p. alba, A. longiflora, A. Verschaffelti, A. Edmond Boissier, Harrison's Musk, Lachenalia pendula. Ferns, such as Goniphlebium subauriculatum, Davallia bullata, D. dissecta, Adiantum concinnum latum, A. trapeziforme, &c.

NAMES OF PLANTS: *J. W.* 1, Eriobotrya japonica (Loquat); 2, Olearia Haastii.—*Joseph Kent, Hanley.* The seed is that of Trapa bicornis—the Ling of the Chinese. This and several other species contain a deal of starch, and in some places form a great part of the food of the natives, where the seeds are known as the Singhara Nut and other names. They are water plants, and for anything we know the seeds should germinate under the treatment you extended, provided always that the seeds are good when you obtain them. The one sent was quite rotten and worthless.—*T. Wickson.* Streptosolen Jamesoni.

RATING OF GREENHOUSES: *H. W. S.* See our issue for September 10, 1892, p. 308.

SEEDLING FERN: *A. C.* From the appearance of fronds sent, they differ but little from A. gracillimum, and we think that if there is any improvement it must be in the habit of the plant.

TREE CARNATIONS: *Foreman and G. K.* Carnations, both "tree" and other varieties, live for several years, and there is no reason why, with proper treatment, the 1-year old Tree Carnations now flowering should not again flower at the time you name. It will be prudent not to let them flower so much as they naturally will do, but cut off the blooms, and keep the plants rather dryer for several weeks, accommodating them in a cold frame till the end of April; and before starting them after their rest, removing some of the old soil and repotting them. Tree Carnations, i.e., the varieties which give a long succession of bloom if wanted to flower in winter and spring, may be struck from cuttings taken from plants which have been growing all the winter. The cuttings should have a certain degree of firmness, and the bottom leaves need not be removed. Fill 48's with sandy loam, surface with clean sand, and put a dozen cuttings in each pot, plunging them in a bottom-heat of 80° in a close frame, preferably, a hotbed out-of-doors. Guard against damp by affording a little ventilation if the frame be somewhat steamy, and rather more if the sun raise the warmth above 80°. Later in the season, when, owing to greater sun-heat, more air must be afforded a hotbed frame, the pots will be the better for being covered with a bell-glass. The cuttings must be watered sufficiently to keep them from flagging—not more, using a light kind of shading.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

TO FLORISTS.—Situation wanted by a young Lady in a Seed and Florist Shop.—C. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S OINTMENT and PILLS.—Much watchfulness must be exercised at the present time, and the earliest evidences of ill-health must be checked, or a slight illness may result in a serious malady. Relaxed and sore throat, diphtheria, quinsey, coughs, chronic cough, bronchitis, and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of these diseases during infancy and youth. Old asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have brought round many such sufferers, and re-established health after every other means had signally failed.

AWARDED TWENTY PRIZE MEDALS
AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

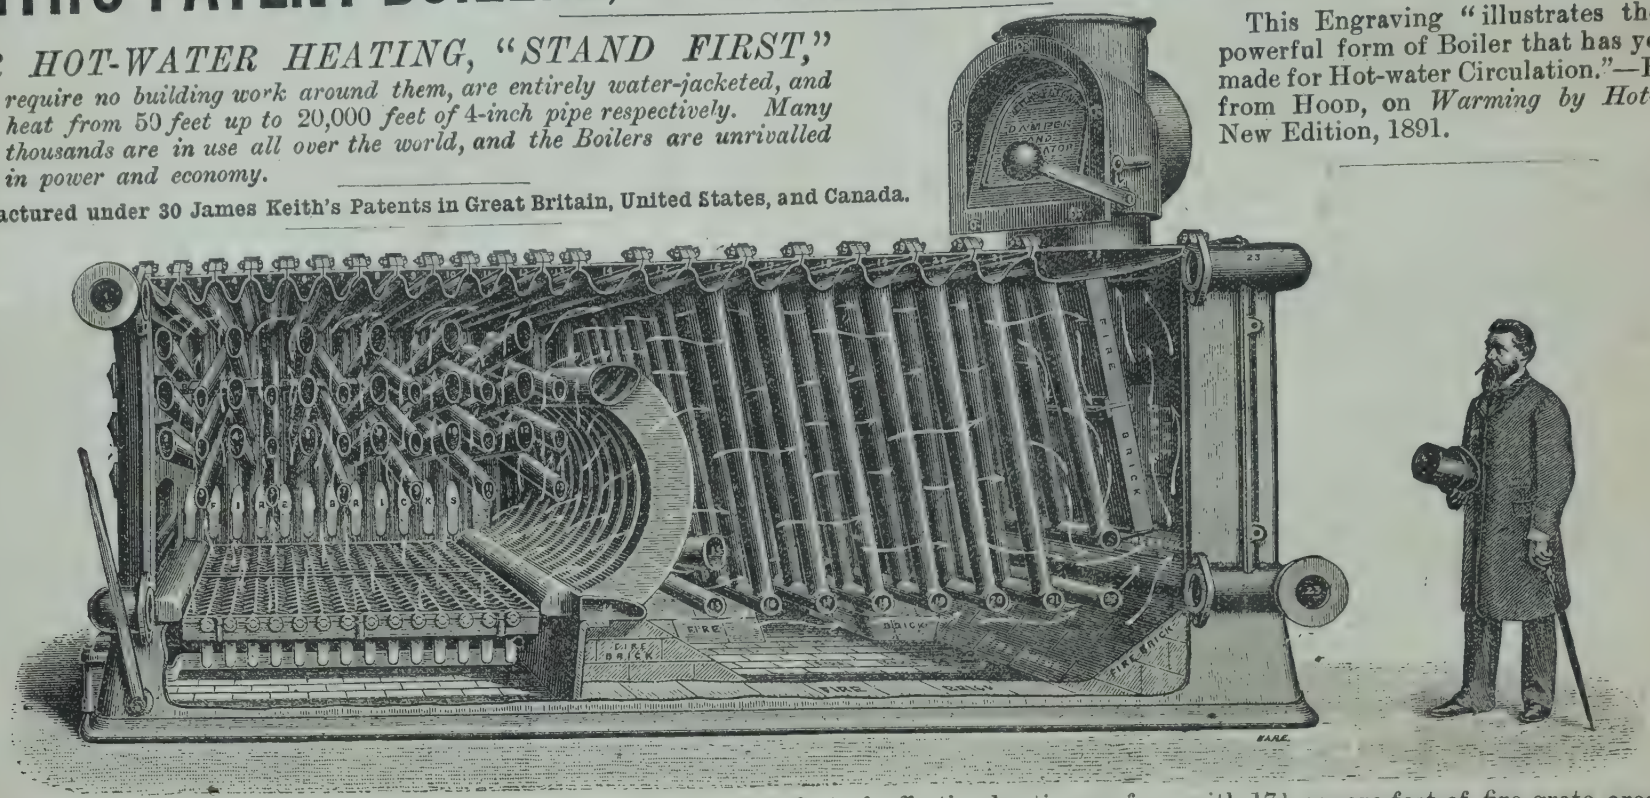
KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST,"

require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from HOOD, on *Warming by Hot-water*, New Edition, 1891.



KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with 17½ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

On view morning of Sale, and Catalogues had.

Heston, Middlesex.

On the main Bath road, near Cranford, Whitton, Hounslow, Isleworth, &c.

VALUABLE FREEHOLD PROPERTY, comprising about 12 acres of prolific Market Fruit Gardens, with all the requisite appliances for carrying on the business of Fruit and Vegetable growing on a large and profitable scale. Also a capital brick-built and slated Residence of eight rooms and foreman's lodge, the whole enclosed within fences, and with extensive frontage to the Bath road, about 1¾ mile from the station at Hounslow within half a mile of Hounslow Barracks Station, and about a dozen miles of Covent Garden Market.

MESSRS. SAMUEL B. CLARK AND SON will offer the above important FREEHOLD PROPERTY for SALE by AUCTION, in one Lot, at the MART, Tokenhouse Yard, E.C., on TUESDAY, January 31, 1893, at 1 o'Clock precisely.

Particulars, with conditions, of the Solicitors, Messrs. BIRCHAM AND CO., 46, Parliament Street, and at the Auctioneers' Offices, 8, New Cavendish Street, W., and 10, Hanover Square, W.

WANTED to RENT, or with view to PURCHASE, some modern-built HOUSES, suitable for Cucumber and Tomato Growing.—T. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand.

WANTED to RENT, a SMALL NURSERY, connected with Shop, in a thriving country town or suburb. Must bear strictest investigation.—Apply to H. E., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

WANTED to RENT or LEASE, a small NURSERY or GARDEN, containing a few Glasshouses, and an Acre or Two of Ground.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOR DISPOSAL, SUMMERHOW VINERIES, Kendal, consisting of about 20,000 feet of Glass, well stocked with Vines, Neil Roses, Maidenhair Ferns, &c. Suitable also for Tomato Culture. Heated with 3900 feet 4-inch Piping by two Boilers.

Particulars on application to owner, A. DUNCAN, Summerhow Vineries, Kendal.

SURREY.—Seven miles from Covent Garden. Genuine NURSERY BUSINESS, 3 acres and 13 Greenhouses, stocked, and well heated; Dwelling House and Outbuildings, all in good repair. Lease unexpired, 16 years. Rents, £115 and £40. West End Shop at £200 a-year. Turnover, about £5000. Price as a going concern, £1000. Strict investigation invited.

Full particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C. (Folio 7808.)

FOR SALE, Compact (Leasehold), Provincial, Hardy Plant NURSERY, in full and successful working. The Stock of Choice Hardy Plants, ready for the coming season, is large and very complete, second to none in the country, systematically arranged and true to name. This Established Nursery is splendidly situated, with Glass and all requisite offices. It is an increasing business, and a sound investment for anyone desiring a pleasant and profitable occupation. Price about £750; half might remain at interest.

Particulars to *bonâ fide* applicants only, DELTA, 205, Upper Brook Street, Manchester.

FOR SALE, satisfactory reasons for disposal, a small compact NURSERY, mostly Glass. Substantial houses; low ground rent; over 90 years unexpired lease. Price, including Stock and Fixtures, £1500. £500 could remain at 5 per cent. Good business-growing district of Seaside Town.—Apply, M. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

CANADA.—DESIRABLE FRUIT FARM.

"THE PINES," NIAGARA.

An opportunity occurs to acquire this very Desirable Property, in fine working order, and situated in

THE BEST FRUIT-GROWING REGION IN CANADA.

The Farm consists of 50 acres fine loamy soil, most favourable to fruit growing, is well watered, and stocked with the best varieties of Apple, Pear, Plum, Cherry, and Peach Trees, Grapes, &c. The Live Stock includes four Cows, two Horses, &c., and the Implements comprise all those required in Fruit Cultivation. The Residence is an excellent Ten-Roomed stone-built house, with Dairy, Barn, Stable, and other outbuildings, and there are Ornamental Trees, Shrubs, with Lawn, &c. It is pleasantly situated in the Niagara Peninsula, between Niagara River and Lake Ontario, and 1½ miles from the Steamboat Landing and Railway Station of the town of Niagara (a favourite Summer Resort), thus affording ready access to the best markets, as well as every social advantage. Inclusive Price for the Property, Stock, and Implements, $12,000, on easy terms, viz., $5000 Cash, and Balance on Mortgage at 6 per cent. per annum. The Property, if properly worked, will yield a clear income of $2000.

For particulars, address No. 163, KEITH AND CO., Advertising Agents, Edinburgh.

FRIDAY NEXT.

FROM FRED. HORSMAN & CO., COLCHESTER.

RICHARD SMITH & CO., WORCESTER.

London County Council,
TO BUILDERS AND CONTRACTORS.

TENDERS are invited for the ERECTION of a CHRYSANTHEMUM-HOUSE at FINSBURY PARK.

Persons desirous of submitting tenders may obtain a copy of the form of contract, specification, form of tender, instructions for tendering, and drawings, on personal application at the office of the Architect of the Council at the County Hall, Spring Gardens, S.W.

The contractor will be bound by the contract to pay to all workmen employed by him the rates of wages and to observe the hours of labour recognised at the date of the tender as fair by the several Trades Unions of the district in which the work is to be done, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

The tenders, which must be on the form supplied by the Council, are to be addressed to "The Clerk of the Council," and endorsed "Tender for Chrysanthemum house, Finsbury Park," and must be delivered at this Office before 10 o'clock, A.M., on February 28, 1893, and no tender will be received after that hour. Any tender which is not in accordance with the instructions for tendering will be rejected.

The Council does not bind itself to accept the lowest or any tender.

H. DE LA HOOKE, Clerk of the Council.
Spring Gardens, S.W., January 25, 1893.

City and County of Newcastle-upon-Tyne.
TO NURSERYMEN, &c.

TENDERS are required for Supplying, Planting, and Maintaining TREES and SHRUBS on the Town Moor, in Four Sections. Specifications, Form of Tender, and all other information can now be obtained at the City Engineer's Offices, Town Hall, Newcastle.

Sealed Tenders, addressed to the CITY ENGINEER, and endorsed "Tender for Tree Planting," to be left at his Offices, on or before Thursday, February 2, 1893.

The lowest or any Tender not necessarily accepted.

Gardeners' Chronicle.

SATURDAY, JANUARY 28, 1893.

NOISETTE ROSES.

SOMEWHERE in the early part of the century, about probably the year 1815, [1819?] when Europe began to breathe after the struggles of the Napoleonic wars, one Phillippe Noisette, a Frenchman, settled in America, sent home to his brother, Louis, a nurseryman at Paris, a seedling Rose, which created an immense *furore* at that time. It was a cross between the old Musk Rose and the common China, and remarkable for its peculiar fragrance and the unusual character of its growth, which caused it to attract a good deal of attention. Since that period a number of varieties have been added, differing very widely from one another, and apparently the result of the intermixture of Teas and other Roses, either by natural or artificial hybridisation. These have so confused the class, that it is now somewhat difficult to separate some of the Teas from the Noisettes; the departure from the original type is seen in various ways, but especially in their losing the character of blooming in large clusters, while retaining their long straggling habit of growth. The Gloire de Dijon is generally classed as a Tea, but I contend that it is a Noisette, which seems to me to be sufficiently indicated by its long, loose habit of growth. Some growers have indeed, and I think wisely, put it and its progeny into a distinct class, under the name of Dijon Teas; but I should feel rather inclined to call them Dijon Noisettes. There is again another departure where the floriferous character is maintained, but with a most evident touch of Tea blood in the flowers, such as in that universal favourite, William Allen Richardson, and in L'Idéale. But perhaps the most remarkable departure has been in the case of that magnificent Rose, Maréchal Niel; of the parentage of this grand flower nothing is known, in its foliage it bears evident marks of its Tea origin, which is also evidenced by the fragrance of the blooms, which are generally single and never in clusters, like the earlier Noisettes. The presumption that it is a seedling of Chromatella, or, as we know it, Cloth of Gold, in one of its points is even strong; for in the vigour of its shoots and their great length, it is unmistakably a Noisette.

The character of growth belonging to this division makes them suitable for the covering of walls, houses, &c. There is one defect which may, however, be remedied—they grow so very long that the bottom of the shoots seem bare, and present an ugly aspect. I have successfully used the Clematis to hide this, planting it at the

foot of the plant, and allowing it to fill in the bare space. I have also used Exogonium purga (the Jalap plant) for this purpose, and, indeed, any bushy deciduous plant will do equally well.

The culture of this section, more especially that which may be called the Tea-scented Noisette section, differs very little, except in the situation, from the Teas; that situation should be either against a wall or fence, or, in the South of England, a pillar, for they make very good pillar Roses. A hole should be dug about 18 inches deep, and in the bottom of this some decayed manure (not too much) should be placed; the hole should then be half filled with turfy-loam, and on this the Rose should be planted, so as to avoid the contact of the young roots when they begin to grow, with the manure, which is apt to rot them, and destroy their vitality. If the plant is against the side of a house or fence, the stem should be nailed to it; if for a pillar, the shoots should be gathered together, and tied; and if the weather is severe, a little bracken should be placed among them. In the spring the shoots should be loosened, and the bracken taken away; in the autumn it is well to put a little loose litter on the base of the plant, so as to protect it from frost · sometimes, in a cold situation, shelter is given to them, but they will, when well established, stand a good deal of cold.

In treating of the best varieties of Noisettes, I shall only mention those of a rampant habit. Some people talk of climbing Roses, but, in truth, there is no such thing, for no Rose has tendrils by which to lay hold of anything. Therefore, I shall say nothing of such kinds as Fellenberg.

Celine Forestier.—This is a charming Rose of a rich sulphur-yellow, and retaining the old habit of the Noisette, viz., that of blooming in clusters. This is one of those Roses which, by a happy chance, was rescued from oblivion. Little was known about it, and, as multitudes of Roses were coming over each year from France, it might well be overlooked; but the late Mr. John Standish paid a visit to Angers many years ago, in which I accompanied him, and there Travillard, André Leroy's foreman, brought him to see this Rose. He was much taken with it, and became its purchaser, and it has been since then very generally grown. It is not an exhibition Rose, but as a pillar or garden Rose, it is very useful.

Cloth of Gold.—Unhappily, as a rule, this grand flower does not succeed out-of-doors. There are exceptions. There was one when I came here, about twenty-five years ago, on a house situated in a warm sheltered spot facing the south-west on a sandy soil, and here it was covered with its grand flowers, some 200 blooms hung on it, although not so deep in its yellow as Maréchal Niel. It has a grand petal, and its footstalk is so stout that it stands upright, unlike the Maréchal, which hangs its head. There are some favoured spots where it will grow, but it is unsuited for general cultivation out-of-doors. In warm climates, in the Channel Islands, and the South of Europe, and the Azores, it climbs high trees, and its beautiful blossoms show up above the foliage; but, as I have said, here it is only rarely that it does well. I planted it on my house many years ago, but after two or three years it succumbed to a severe winter, and I have never tried it again.

L'Idéale.—A very delightful Rose of recent introduction. It is a gem for button-holes, and the colour is an exquisite combination of yellow and red.

Maréchal Niel, the grandest of all Noisettes, and with perhaps the exception of Niphetos, there are more blooms sold of it than of any other Rose in cultivation. I have often told the story of my seeing it in Paris before anything was known of it here, and of my predicting a great future for it, and surely it has had a grand success, and yet withal, as an out-of-doors Rose, its merits are not of the first character. The outside petals are apt to get damaged by the weather, and then, as the footstalk is weak, it lays down, and the bush looks as if half covered with withered Roses. The proper place to see it, is trained on the rafters of a house, where its golden goblets hang down, and are seen in perfection. I have seen trees on such an aspect with hundreds of blooms suspended from them.

Rêve d'Or is one of the very best of the Tea-scented Noisettes. I have had a magnificent plant of it on the east side of my house for a number of years, and have had thousands of blooms on it, a perfect picture, because unlike the true Noisettes, it has no bare shoots, but more like Maréchal Niel, is clothed down to the ground; the foliage is nearly evergreen, the colour a rich orange-yellow. My plant was killed to the ground many years ago, and I had almost made up my mind to dig it up; it, however, shot forth, and bids fair to recover its lost ground. I know of no better Rose for rapidly covering a large space.

William Allen Richardson, or as it is more familiarly called "William Allen," is too well known to require description or recommendation; every one who has a garden knows what a favourite it is, especially with ladies, its bright orange blooms being used for decorative purposes of all kinds, and is a universal favourite. It is very vigorous in growth, and a friend has a stout walking-stick made not from a main stem, but from one of the side shoots. It is somewhat like Madame Falcot in colour.

Solfaterre, a large rambling variety of deep yellow colour; the flowers are somewhat loose and thin, opening quickly in sunlight.

These are about, I think, the most desirable of the Noisettes, and it will be seen that they vary very much in character; in fact, it becomes difficult to mark the line between Tea and Tea-scented Noisette; and I think, like a good many other things, as, for instance, show and fancy Dahlias, it is a state of things which it will be impossible to alter.

It would hardly be well to write of Noisette Roses without alluding to the Gloire de Dijon seedlings, which by some growers are now catalogued as Dijon Teas, for, as I have already said, they have much more affinity to the Noisettes than the Teas; their long straggling habit, and the fact that although they give some second flowers, they are nothing like so floriferous as the Teas, justify this statement. It is impossible to say what their origin is. The type came up as a chance seedling in the garden of Jacotot at Dijon, and has established itself as one of the most popular, if not *the* most popular, of Roses. Unlike Maréchal Niel, it will flourish anywhere, in cold as well as warm situations, and in almost any kind of soil. Very many seedlings have been raised from it, and few excel it in beauty of colour, though some are superior in point of form, for Gloire is rather confused in the centre, and is seldom seen in an exhibition stand.

Belle Lyonnaise, a very vigorous and beautiful Rose, has a bad habit of quartering, but can hardly be dispensed with. It is a very constant bloomer.

Bouquet d'Or, perhaps the very best of all the progeny of Gloire de Dijon; very vigorous, not over rampant, forming a good bush, and on a wall most useful. The form also is good, and altogether a most desirable Rose. I do not as yet see much in the Hungarian Roses of this type, Kaiser and Kaiserin Friedrich, as I could rarely get them to open. Henriette de Beauvois and Emilie Dupuy are good, and so are Madame Bérard and Madame Trifle, but too near the type to be very much desired. All those that I have mentioned have made good pillar Roses, and as they occupy a good space on a wall or house, it is not everyone who can give that to them, and so they become useful for pillars or arches. The milder weather which has succeeded that sharp nip of frost we had, makes it quite possible to plant them with advantage; and it must be always borne in mind that Roses of these varieties require no pruning—in the strict sense of the word. Breast wood and weakly wood should be cut out, and the tips occasionally slightly shortened, but that is all; in fact, the less of the knife they have the better. *Wild Rose.*

NEW OR NOTEWORTHY PLANTS.

ARUM PALÆSTINUM.

We owe to the kindness of Mr. Ware, of Hale Nurseries, Tottenham, the opportunity of figuring this handsome Arum. It is fully described in Boissier's *Flora Orientalis*, v., p. 37 (1884), as well as in the *Botanical Magazine*, t. 5509; and this circumstance, together with the illustration given at p. 101, fig. 17, renders it unnecessary to repeat the technical details. The plant, it will be seen, is in general habit much like our common Arum, but the spathe is more lanceolate in outline, and in colour of the richest maroon-purple, looking like velvet, whilst the naked end of the slender spadix is sooty-black. The plant is thus very handsome in appearance, and destitute of the odour which is so extremely objectionable in some of its allies. The specimen figured is exceptional, in the presence of a double spathe. Every year we receive several similar forms in the case of the Richardia æthiopica, the Arum Lily of the markets, so called, probably because there is not very much more affinity between a Lily and an Arum than there is between a cuckoo and a cockchafer. It would obviously be desirable to "fix" the peculiarity above alluded to, and no doubt it might readily be done.

LÆLIA HYBRIDA NORMANNI, *Kränzlin.*

This new hybrid was obtained by crossing Lælia pumila var. marginata (seed plant), and Cattleya Dowiana (pollen plant). The differences between Lælio-Cattleya Ingrami and this new hybrid are, of course, only slight, but we may observe that the petals are more rhombic instead of ovate as in L.-C. Ingrami, and that the middle lobe of the lip is flatter and more plaited than in this variety. The colour of the sepals is a very tender rosy-purple, whilst the petals are somewhat darker. The lip is pale purple in the middle, with a very broad, purplish-mauve margin on the side lobes, an anterior or middle lobe of the same colour. The whole discus or middle part of the lip is beautifully veined. The column is white, and has the three little teeth peculiar to L. pumila. As there are eight pollen-masses (four greater and four smaller ones), the plant is (botanically speaking) a true Lælia; also the bulbs and leaves are more in the way of a Lælia than Cattleya-like.

The plant is a very valuable addition to our stock of ornamental hybrids, and was raised by Norman C. Cookson, Esq., Wylam-on-Tyne, whose fresh materials are to hand. Lælio-Cattleya Ingrami was raised between Lælia pumila Dayana and Cattleya aurea, and Mr. Cookson's hybrid has been raised between a fine variety of Lælia pumila marginata and Cattleya aurea. There is a conspicuous absence of the lines in the throat in the hybrid of Mr. Cookson. *Dr. Kränzlin.*

VERBENAS FROM SEED.

Verbenas are beautiful subjects for summer bedding, but unfortunately of late years, these, like many other old florists' flowers, have contracted a disease which has been so destructive as to practically expel them from many gardens. This disease is much more prevalent among plants raised from cuttings taken off of plants kept through the winter. The cuttings are also very liable to damp off, and seldom form such strong and healthy growing plants as seedlings. Fortunately these may be treated as half-hardy annuals, and are particularly easy to raise. As the plants will grow well in any fairly good soil, and possess a grand variety of colour, there is no reason why they should not be as popular as they were a few years ago. The only drawback in seedlings is, that you must necessarily wait until the plants have produced a flower before you can decide upon their colours. For my own part, I much prefer to see a mixed bed obtained from a good and carefully-selected strain. The seed is fairly cheap, and a small packet will produce a large number of plants.

Given a warm frame or ordinary greenhouse, and dozens of these may be raised as readily as Stocks and Asters. I have found the following plan excellent and sure:—Sow the seed in a box some 3 or 4 inches deep, filled to within an inch and a half of the top with leaf-soil, loam, and sand. Let this compost be sifted, and the rougher portions placed in the bottom of the box, finishing off the surface with a finer mixture, and making all fairly firm. Now thoroughly saturate it, and sow the seeds thinly, covering them over very slightly, and keeping them close and dark with a shaded square of glass. Stand the box in a warm corner of the greenhouse, or in a mild Cucumber or Melon frame. As soon as the seeds have germinated, light and air should be gradually admitted, and the plants be raised close to the glass in a frame, or placed on a shelf if in the greenhouse. When the seedlings are some 2 inches high, they may be either pricked off into other boxes, or potted up singly, using a pot of 2½ to 3 inches in diameter; or they may be allowed to get a little larger and then have their points pinched out, planting them out in the soil of a spent hot-bed as soon as fresh growths start. Under either treatment they should have their tips pinched out a couple of times before making much progress. This will ensure bushy and stocky plants for bedding out by the end of May or early in June; I prefer the latter date. If well-watered previous to lifting from the frame, they will be movable with a good ball of soil attached, and will not flag much from the shift to the flower borders.

Few subjects pay better for generous treatment than the Verbena, and they will rapidly cover a large space of ground, and remain in bloom until frost cuts them down. If you can dig in a fair amount of well-decayed manure, such as the remains of an old hot-bed, the plants are certain to thrive luxuriantly, and prove one of the most satisfactory of all bedding subjects, especially when the cost is taken into consideration.

Verbenas may also be raised in a cold frame, or on a warm outside border; but this does not conduce to such forward plants, and they do not come to perfection until late in the autumn. April is soon enough to sow them in the cold frame or open border; but if sown in heat during March, you can be certain of securing plants that will commence blooming early in the season, and remain gay all the summer and autumn. *A. P.*

ROUND MANCHESTER.

(*Continued from vol. xii., p. 793.*)

Stand Hall, Whitefield.—The property of T. Statter, Esq., occupies a fine situation on high ground, and commands a beautiful and varied prospect of the surrounding country. From the terrace of its pretty and well-kept gardens, some thirty churches can be counted, and it was the fine position doubtless which caused the old Stand Hall, which dated from the Middle Ages, to be placed there; and a fine edifice no doubt it was, for its ruins, and their foundation, had to be blasted to clear the site for building the present solid and comfortable structure. One curious feature of the olden time still remains, and is an object of great interest to archæologists, and that is the chapel with its beautifully-carved roof and other appurtenances of a sacred edifice, but which so far back as can be traced has been used as a cow-house, and a cow-house it still remains, for the present proprietor has it occupied by as many of his 500 head of horned cattle as it will accommodate.

The gardens are well kept; the Vines in the various vineries are in a fine bearing condition, the various greenhouse and stove-plants and Palms all that could be desired, but during the time of the late Thomas Statter, Esq., a taste for Orchids was added to his other hobbies of pictures, horses, and old china; and so well did the Orchids thrive under the care of Mr. Robert Johnson, the gardener then, as now, that when, at the death of their owner, they were sold off, their fame secured a large attendance and spirited competition for the good things offered.

But the fame of Stand Hall for a collection of Orchids was not to be allowed to depart in that manner, and as soon as convenient the present proprietor laid the foundation of another collection, by which the former one seems in a fair way of being eclipsed, if we may judge by the numerous fine things which have been shown at the meetings of the Royal Horticultural Society, and by what we saw on the recent occasion, when we were accompanied round the gardens by their owner and his clever and industrious gardener. Rare and showy hybrid Orchids are eagerly taken up at Stand Hall, and among the specimens we noted a very large plant of Lælio-Cattleya Amesiana ×, with several flowering growths; a fine plant of L. C. Arnoldiana ×; L. c. exoniensis×, several L. c. eximia×, L. c. Canhamiana×, L. c. Pallas×, L. c. Bella×, L. c. Nysa×, Cattleya Harrisi×, C. Minucia×, C. Parthenia×, and many other fine hybrids; while among those not yet flowered are some promising plants obtained from seeds, Lælia crispa×, L. pumila præstans, which should be good. Various forms of Cattleya aurea and C. Warscewiczi are well represented, two of the very finest being C. Statteriana which much resembles a white-petalled C. Hardyana and C. aurea Statteriana, which is one of the richest yellow-flowered Cattleyas, being entirely yellow-coloured except for some rich crimson rays on the lip. Forms of Lælia elegans Turneri are likewise favourites here, and some of the best of these have been added to the collection, of which the handsomest and most distinct is L. e. excellens, a flower with pure white side lobes, and labellum base. Rare varieties of Dendrobium nobile are much valued here; and, in addition to the beautiful D. n. Cooksoni, D. n. virginalis, D. n. Hardy's var., D. n. Sanderiana, and D. n. nobilius, there is said to be a yellow-flowered D. nobile in the collection, which will make a great stir in the Orchid world when it gets strong. The growths which these Dendrobes have made are remarkable for size; those, for example, on D. n. nobilius being over 3 feet in height, and so also proportionately with other rare varieties we noted, viz., D. Wardianum album, D. Bensoniæ album, D. crassinode album, D. Venus×, &c., all were grown to perfection.

Among the Cypripediums which were encountered in company with many other fine forms, were Cypripedium Saundersianum×, which used until recently to be valued at a fabulous price; C. Swinburnei×, C. insigne Sanderæ, and a new form of the C. i. Chantini section—a very fine thing; C. Leeanum superbum ×, C. L. giganteum ×, C. Aylingii ×, C. Niobe ×, C. Englehardti ×, C. Stonei Cannærti, besides some rare unflowered hybrids.

In other houses the Lælia anceps varieties, L. autumnalis, L. Gouldiana, were flowering grandly, one of the richly-coloured L. anceps Morada, of the Liverpool Horticultural Co., having eleven spikes; Cattleya Victoria Reginæ, or the beautiful form of C. Leopoldi, imported with it, was about to flower; C. Alexandræ and other species were in bud; Lycaste Skinneri alba had fourteen flowers, and L. S. xanthoglossa was fine; and Odontoglossums, &c., were all in fine condition.

(*To be continued.*)

LIME IN THE GARDEN.

The present time of the year, together with early spring, being suitable for the application of lime, it may not be out of place to consider briefly what are its manurial properties, what classes of soils are most likely to be benefited by its addition, and in what form it can be most advantageously used. This is the more desirable, as the usefulness of compounds of calcium seems somewhat liable to be overlooked or under-rated.

It is well to remember, in the first place, that the function of lime in the soil is two-fold—it is a direct plant-food, and it also possesses a remarkable power of rendering other inert matter suitable for the nourishment of plants. Besides this, it is capable of making considerable modifications in the physical condition of soils—a matter quite as important to the cultivator as its chemical composition.

Lime as a Plant Food.

It is scarcely necessary to point out here the fact that calcium is one of the elementary bodies that are absolutely necessary for the complete growth of plants; but it is not always borne in mind that some garden crops remove comparatively large quantities of this substance; and that, moreover, lime is a body which, to adopt the common phrase, "sinks" in the ground, thus rendering its application from time to time advisable. That leguminous crops, such as Peas and Beans, need large quantities is fully recognised, as is indicated by their popular description as "lime" plants. But there are many vegetables, which from their marked preference for manures containing other elements, are rather liable to be starved in the matter of lime, although the latter may be no less necessary for their full development. Turnips, for instance, need much phosphoric acid and potash, but analysis of their ash shows about 49 per cent. of lime (13·024 per cent. in the roots, and 35·65 per cent. in the leaves *). Potatos, again, show only 3 per cent. of lime in the ashes of their tubers, but their haulms contains about 17 per cent.; and it is upon the leaves, be it remembered, that the tubers have to depend for their supply of starch. Many other instances might be given of the importance of lime as a minor constituent.

It was stated above that lime sinks in the ground. The explanation of this is very simple. Rain-water holds in solution carbonic acid gas, which it has absorbed from the air, and thus charged, it has the power of dissolving the carbonate of calcium in the soil, and carrying it away off the surface and through the drains or porous subsoil. Moreover, the carbonic acid formed in the soil by the decomposition of organic matter dissolves the carbonate of calcium, which is carried away by drainage water. The nitrates and chlorides of calcium are likewise readily diffusible, and easily lost. It may be noted in passing that the alkaline base soda suffers from this washing-out process in common with lime, while most fertile soils are strongly retentive of ammonium and potash. Hence the reason why lime must be added in larger quantities, and more frequently, than a calculation of the actual amount removed by any given crops would seem to warrant.

What Soils are Most Likely to be Improved by Lime?

Briefly, all deficient in calcareous matter, stiff clays, and sour peaty soils are particularly responsive to its application. Stiff clays are lightened and rendered warmer and more friable,

* From Dr. A. B. Griffith's Analyses in the *Journal of the Chemical Society*, 1883—87.

and the soluble plant foods are increased by quicklime; whilst, on the other hand, the retentive power of light sandy soils is increased by the addition of slaked lime (calcium hydrate), chalk (carbonate of calcium), or marl. On soils containing a large amount of peat, quick or slaked lime, is of great value, counteracting the "sourness" due to excess of organic acids, and assisting the decomposition of woody fibre, &c. There is another case in which lime may be applied with very marked results, namely, to old garden ground which has year after year received heavy dressings of farmyard manure, and which have become sour and profitless. Mr. J. Wright, in a paper read before the Royal Horticultural Society in 1889, described a striking but by no means uncommon instance of this. When he took possession of the garden in question, he found it like a mass of humus, nothing would grow satisfactorily, the soil being "poisoned with humic acid." He gave it a good dose of lime (a bushel per rod), together with potash and bone-meal. "The effect," says Mr. Wright, "was magical, and the crops of Potatos and Peas, where they would not grow before, were remarkable." The late Mr. Shirley Hibberd, on the conclusion of the above paper, remarked on the too frequent neglect of lime as a corrective of acidity; and Mr. G. Wythes—than whom, perhaps, no one knows better how old garden soils should be treated—expressed himself in favour of lime, soot, and wood-ashes, where organic manures alone had been given for a long series of years.

The Various Forms of Lime.

As a general rule as indicated above, *quick-lime* (put on in its caustic condition, or slaked by adding water, or by leaving it exposed to the atmosphere for a time), is preferable for heavy soils, and may be applied at the rate of from 2 to 9 tons per acre. It should never be applied with manures containing ammonia, the latter being liable to be driven off thereby.

Chalk is suitable for light sandy soils, and can be given in about twice as heavy dressings as caustic lime.

Marls, being variable mixtures of carbonate of lime and clay, are suited to light land, the dressing being regulated by the proportion of lime contained.

Gypsum, or sulphate of calcium can be used with ordinary manure, as it is a "fixer" of ammonia.

Gas Lime is simply slaked lime which has been used in the purification of coal-gas. It contains, when fresh from the works, calcium sulphide and sulphite, and these substances are injurious to plants. After exposure to air, however, they are oxidised and form sulphate of lime (gypsum), and consequently become innocuous. Gas-lime is useful for mixing in the "rot-heap," hastening the decomposition of leaves, weeds, &c.

It should be remembered that bones, bone-meal, dissolved bones, and superphosphate all contain more or less calcium; therefore, liming is not so necessary where any of these are applied in quantity. *C. W. Herbert Greaves, Marlborough Lodge, Bournemouth West.*

THE ROSERY.

ROSES AND THE FROST.

To-day (January 19) I have been looking over my Roses, and forming an opinion of the harm done by the recent severe weather. I am gratified to find that they are coming through the ordeal so well. Early in the month we had some very low readings of the thermometer, and these were often accompanied by a keen north and north-east wind. Several mornings we have had over 20° of frost, and as this was accompanied by sudden changes and slight thaws, only to freeze again at night, I am rather surprised to find my plants show small effects of the frosts.

For some time there has been a considerable amount of ice around the base of many plants; and, in the case of budded dwarf stocks, where the soil was partly removed to get the bud closer to the crown of the stock, the bud itself has been encased in ice for fully a week. Notwithstanding this, I find the buds are looking well, and have every appearance of being uninjured.

At the time of writing, a steady thaw has set in, and upon cutting some of the wood with a knife, I find the pith is sound, and of good colour. The three varieties most affected are Catherine Mermet, Climbing Niphetos, and Souvenir d'Elise Vardon. Comtesse de Nadaillac, generally considered a tender Rose, has come out as well as the others. I find this Rose as hardy as any, and doubtless its character for tenderness is derived a great deal from its steady and comparatively weak growth. In an open field, facing due north, my standards are pinched rather; but on the south side of the same hill they are looking as well as the dwarfs.

At a future date, when the frost is quite gone, I will report upon how the buds that have been encased in ice turn out. From their present appearance, I have little fear of them. *P.*

EFFECTS OF ENVIRONMENT ON FRUIT TREES AND ROSES.

By the word environment, I mean more than what is generally included in the terms soil and climate. These, it is true, are among the more potent factors in determining the measure and quality of production. Only the veriest tyro in the secrets of cultivation can affect to underrate their superlative importance. The soil dominates root conditions and supplies; the air determines the measure, and moulds the quality of plant products. From neither does there seem any escape. And yet outside of both soil and climate, as generally understood, innumerable minutiæ go to constitute local environment. Among the latter, perhaps altitude, or the height and form of surface-ratio of water to land; of grass land or plantations compared to arable; the proximity or otherwise of troughs, of valleys, mountains, lakes, rivers, seas; varied character and depths of subsoils and surface tilths, measure of water supply and its normal condition, whether at rest or in perpetual motion.

Such, and probably other and even smaller local environments often determine the most vital issues of success or failure in horticultural production. In this great art, nothing is really of little moment, and the usual terms of small and great get mixed, and are apt to prove very misleading. And the worst of it is, the most lynx-eyed cultivators are apt to prove somewhat blind in littles. Take, for example, the choice of a site for a fruit garden or orchard. The soil is tested with the utmost care. No pains nor cost is spared in its cultivation and enrichment; no skill nor experience is spared in the selection, planting, culture, and training of the choicest varieties. Similar trees in the district also do well; the new planters have only to tread in the footsteps of the old, and all will be well, for is not old John Hortus retiring with a fortune, only about five hundred yards off, and a little higher up the hill? Yes, this is quite true; and as like will produce like, as a rule, even in horticulture, all that is needful to reap fame and fortune is to keep close to John Hortus' example. And that is the loyal intention of his successors and imitators; and they have, in all the big matters of the choice and planting of the new fruit garden or orchard, trodden in his footsteps. But they failed in that which seemed least—but really was the greatest—condition in commanding success. The new fruit garden was about one hundred feet lower down the rolling ground that seemed made for growing fruit, than the old one. Hence, it was under, not above the fog line. Only practical cultivators of wide experience know all the misfortune involved in trying to grow valuable fruit under the fog line of any district. It is like attempting to cross the Atlantic in a craft flooded to its bulwarks. It may be done once and again, as a happy accident; but, oh! the risk, the work, the worry of it! No naval nor horticultural skipper worthy of his salt would voluntarily pit such tremendous odds against himself. But what difference can such trifling descents in altitude make? Why, probably a fourth of the difference here indicated would suffice to convert brilliant success into dismal failure; for in such cases, it should never be forgotten that things are mostly worse than they seem. The fog line above-ground is often associated or linked closely together with the stagnant water-line below. Either of these often prove more than a match for the cultivator, but where the two combine their forces, the most skilful cultivators will reap only, or chiefly, failure, in the presence of such local environments as a dirty wet blanket around the top, and a perpetual bath of stagnant water at the roots of trees. Proof of the existence of both are often found in the most unlikely places, and there can be no hope of permanent profit or success in fruit culture until the local environments of fruit gardens and orchards are adapted to the wants, and, I should like to add, the wishes of the trees. *D. T. Fish.*

MADRESFIELD COURT GARDENS, MALVERN.

So much has been written of these gardens, that probably there is nothing new to be said; yet gardening is so progressive in some ways as well as conservative in others, that a few remarks upon things seen there lately may not be without interest to readers of the *Gardeners' Chronicle*. Mr. Crump is so well-known to be a thoroughly good all-round gardener, that everybody expects to find good order and good gardening at Madresfield; and anyone paying an unexpected visit, with high expectations, will find them fully realised, and possibly, more than realised, as the writer did.

Entering the kitchen-gardens from Mr. Crump's house, we turn for a moment to the right to examine a Plum-tree on a wall. It is heavily laden with gigantic fruit, deep purple in colour, and carrying a dense "bloom"—it is the "Nectarine" Plum. One is immediately struck with the beautiful condition of all the fruit trees—wall trees, cordons, pyramids. No gross growths, no overcrowding of shoots or branches. Each shoot and each leaf is properly nourished from quantities of fibrous roots kept in the upper and richer and warmer soil, which is kept uniformly moist by mulchings; and each leaf and shoot receives its full share of light and air, without which all conditions, however suitable, are of little use.

The oblique cordon is becoming very popular at Madresfield, so much so, that Mr. Crump has a nice row of Gooseberries about 6 feet high grown in that way, and he is making up all gaps and edgings of quarters with fruit trees grown on that system. Pears Doyenné du Comice, Triomphe de Vienne, Souvenir du Congrès, Jargonelle, and Beurré de l'Assomption are fruiting well in that way.

Amongst uncommon Apples bearing heavy crops are two highly-coloured and valuable varieties, called May Queen and Maltster, the latter a large handsome Apple, the former smaller but very beautiful, and of excellent keeping and eating qualities. Lord Suffield does uncommonly well, forming large, clean, healthy, and fruitful trees. Stirling Castle is also another first-class variety for fertility and quality of produce.

The Peach-houses are now almost without fruit, but the trees are in excellent health, the foliage green, clean, and of good substance; the growths strong and well-ripened. The Peach season at Madresfield commences before the end of April with Alexander, and continues until late in autumn, when immense quantities of the splendidly high-coloured outdoor Peaches are in full swing. Grapes are well grown, as the late crop of Hamburghs amply testified. They are grown for family use, and not for exhibition purposes. The bunches were large and compact, the berries of full size and good colour. I noticed in the late vinery a few bunches of the true Kempsey Alicante; it is distinct in form of berry, is of good colour and dense bloom, and is well

worth a place in vineries. The true Gros Guillaume also was a telling feature in size and finish. The earliest vinery had its roof off, thus exposing the foliage to a thorough cleansing on the upper surface, and also keeping the Vines unexcited, and contributing to a quiet and natural maturity and rest.

There are seven vineries, two of which are planted with Madresfield Court, Black Muscat, two with Madresfield Court and Black Hamburgh mixed, one with Lady Downe's, one Muscat-house, and one of Alicante, Barbarossa, Gros Colmar, &c. There staging on each side and overhead. This is a great boon, and one that would be much valued in many gardens where Strawberries in pots are grown largely.

The Rose-house is a long and spacious lean-to, filled with strong and healthy plants, growing in a raised inside border at the front of the house, the varieties being the well-known and deservedly popular favourites, Niphetos, Madame Lambard, Madame Cusin, President, W. A. Richardson, and Cheshunt Hybrid; and the back wall is covered with

Fig. 17.—Arum palæstinum, with a double spathe: colour, deep purplish-brown; spadix, black. (see p. 98.)

are also three Peach-houses, and it is obvious that to dwell in detail upon the contents of each house would take up a great amount of valuable space. The Fig-house was finishing off an abundant crop of fine fruits, Mr. Crump avoiding here—as in all other departments—the error of over-crowding. In the Melon-houses were to be seen fruit weighing nearly 6 lb.; and in the same structures were splendid batches of perfectly clean and floriferous Gardenias and Eucharis in pots. In the same range of houses were about one hundred pots of Calanthes. Two houses of Tomatos must be mentioned, because probably a finer lot could not anywhere be found, taking plant for plant. A span-roofed house is erected here specially for Strawberries in pots, with Camellias, and the lovely white, but too seldom grown, Clematis indivisa lobata.

Of course, there is at Madresfield the usual collection of large Kentias, Arecas, Seaforthias, Cocos, Ferns, &c., for house decoration, as well as a large quantity of well-grown and beautifully-coloured Dracænas, Crotons, Pandanus, &c., for the same purpose. In a small plant-stove was to be seen a few of the almost forgotten but charmingly delicate pink Pentas carnea.

The kitchen gardens are 4 acres in extent, and are well-managed. Adjoining the kitchen garden is a nursery, mainly of fruit trees, in which Mr. Crump raises thousands of strong and clean trees of the best varieties adapted to the locality, which are gratuitously supplied to the tenants on the estates of Earl Beauchamp. This is a boon that can scarcely be over-valued, and one that is sure to bring its own reward to such a considerate landlord. This nursery is 2 acres in extent, and close by is a trial ground of 1 acre, where upwards of 200 kinds of Apples are on trial. Mr. Crump is acquiring most valuable information concerning these, and some day will, perhaps, kindly impart some of it for the benefit of the readers of the *Gardeners' Chronicle*.

We now enter the pleasure-grounds, which cover 50 acres, where we find weedless walks, smooth velvety lawns with well-trimmed edges, banks of bright green low-kept Laurels, perfect Yew hedges, that do not present a gap or a dead branch; artificial rockeries, a perfect semicircular arcade of Lime trees, avenues of Elms, Cedrus atlantica, and Abies nobilis glauca, each about 400 yards in length, and forming an almost exact equilateral triangle; these and other things we see, and feel utterly unable to accurately describe their beauties.

There is a flower-garden near to the kitchen-garden, where there are a number of long beds edged with Box, and all radiating from near the centre towards the circumference of a semicircle, thus being narrower at one end than the other, but with an average width of about 30 inches inside measurement, or 3 feet outside. These beds are planted alternately with Tea Roses and Carnations; the perfume is delicious, and the effect most charming. Wandering to the rockery, it is difficult to believe that man has had any hand in its arrangement and construction, so gradual and natural is the transition from prim lawns, borders, and hedges to what appears to be Nature in her bold and rugged beauty of form and arrangement. This is considered to be one of Pulham's masterpieces. (See fig. 18, p. 105.)

Passing by the Lime tree arcade, we proceed along the grand avenues of Abies and Cedars, and arrive at the flower-garden proper at the south front of the mansion, which latter is of Elizabethan style of architecture, very roomy, beautiful and comfortable, and surrounded by a moat filled with water. The flower garden is spacious and commensurate in size to the mansion and its surroundings. The beds are large and sufficiently numerous to give the colouring requisite for the picture. In the centre is a very large circular bed covered with a dense mass of the dark purple Clematis Jackmanni. Other beds are filled with well-flowered, crimson, tuberous Begonias, White Viola Countess of Hopetoun, yellow Viola Bullion, the dark purple-crimson Iresine William Coleman, edged with the silvery Cineraria; and to tone down the whole, were several beds of sub-tropical plants.

Leaving the flower garden, we enter a private terrace walk, flanked with high evergreens, and containing a number of marble busts of Roman emperors. Passing by the Elm or deciduous avenue, after leaving the stables immediately on our left and the drawbridge on our right, we reach Mr. Crump's house, and thus end an enjoyable walk round one of the most beautiful gardens, and with one of Britain's most able gardeners. *Hugh.*

Cultural Memoranda.

CHLOROPHYTUM ELATUM VARIEGATUM.

This species, allied to Anthericum, is a very useful and effective decorative half-hardy herbaceous plant. Last summer I introduced it for the first time among the carpet-bedding plants with very good effect, turning the plants carefully out of small pots, and planting in little mounds in central pieces of Alternanthera amœna, and other bright-foliaged plants, with which the narrow pale green and silver-edged arching leaves of this Chlorophytum made a pleasing and striking contrast. The leaves having got nipped by frost at the same time as the Alternantheras, the plants were taken up, and potted into suitable-sized pots, and then placed in a house with bedding plants. In due time a fresh lot of young leaves made their

appearance, the variegation being more delicate and pronounced than it was before. The leaves are from 12 to 15 inches long, and from three-quarters to 1½ inch wide, and not unlike those of Pandanus Veitchii in habit and colour, only they are of less firm texture, and are not serrated. These plants I have now divided, and potted into 3-inch pots, seeing that I cannot well have too many of them for intermixing with other plants for house furnishing, and other decorative purposes. They are not particular as to soil, providing it is light; but if a compost consisting of light sandy soil, peat and leaf-mould is afforded them, the variegation is thereby improved.

PANAX VICTORIÆ.

This is a very useful and showy decorative plant; it is of bushy habit, having compound leaves, the leaflets being green, serrated, and edged with white. It is readily propagated by cuttings inserted in 3-inch pots filled to the rims with light sandy soil, and then plunged in heat near to the glass, and potted off into small 60's as soon as rooted, returned to heat, and watered to settle the soil. The plant does best in a stove temperature, and in peaty soil. *H. W. W.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

SOUVENIR DE LA MALMAISON CARNATIONS.—Last year's layers should be potted as they require it in good loam, leaf-mould, and dry cow-dung, with plenty of sand mixed with it (sea-sand, if it be obtainable). If the young plants are watered before potting, do not water them again for some time, i.e., till they have got dry. Afford attention to old plants in 8-inch and larger pots, as it often happens that they are destroyed by excessive watering at this season. If 2 oz. of nitrate of soda be added to a 4-gallon can of soft water it will help them, as will also a top-dressing of fresh loam to which some chemical plant-food has been added. Air should be afforded the plants night and day whenever possible, and green-fly must be kept from them by fumigating the pit or house at short intervals, not waiting till the pest shows itself. The young leaves are disfigured very quickly by green-fly, and continue to show it in their old age. Temperature—night, 40° to 45°; day, 50° to 55°.

ALPINE AURICULAS.—These are amongst the most useful sweet flowering plants for baskets and house decoration in the spring; they should be grown in 4, 5, and 6-inch pots, and those that have been hitherto kept in frames may now be removed to the stage or table in a cool greenhouse, where their sweetness and beauty may be readily enjoyed. Avoid the use of much fire-heat for them, the temperature at night being 40°, and by day 50°, with plenty of air. A good watering should be administered to those which have thus far on in the season been kept dry at the root.

ROSES.—The borders of Tea-scented and other Roses should receive a top-dressing of good loam and rich manure, and be carefully forked over, affording them a good watering afterwards. If pruning or training is required, it should be done at this season, but the best time to prune Roses in a house is the beginning of the month of October, the Roses being then put in a tidy condition for the winter, and the plants growing beneath the Roses are benefited by the larger quantity of sunlight received. The best time for planting is in July, the plants being grown well, previously, in pots; and when planted as the roots are in full vigour they soon get away. At the present time thoroughly clean them of all insects, and if green-fly be present, fumigate them, or the buds and young growth will suffer; and to counteract mildew, syringe with the mixture recommended on p. 45. A temperature of from 40° to 45° at night, and 55° by day, suits them well, with plenty of air given during mild weather. Where Maréchal Niel is subject to canker, it is good practice to plant some few young vigorous plants each year. Where the following varieties can be planted out into well-drained beds of good strong loam, some blooms may be gathered every day in the year, but the plants should be allowed to grow as strong as they like during the summer, the shoots being well thinned out in the month of October. The first four varieties named are good for button-hole bouquets, viz., Isabella Sprunt, Ma Capucine, Madame Falcot, and W. A. Richardson. Other good varieties are Madame Lambard, The Bride, Lamarque, Marie Van Houtte, Rêve d'Or, Niphetos, Cheshunt Hybrid, Homère, Celine Forestier, Gloire de Dijon, Adam, Duchess of Edinburgh, Goubault, Ophirie, Madame Chedame Guinoisseau, David Pradel, Madame P. Liabaud, Duc de Magenta. The small fairy Roses are very useful grown in 6 or 8-inch pots for flowering at this season.

FORCING-HOUSE.—Hyacinths, Tulips, Lily of the Valley, and other bulbs, will not require much heat to bring them into bloom after this date; and they should be neatly tied to their green-painted stakes when taken to the conservatory. Introduce as required more Ghent, India and Mollis Azaleas, also Lilacs, of which if much house decoration be needed, large plants taken out of the nursery and placed in large pots or tubs are very useful. The Lilac does very well in an early vinery. The different varieties of Cœlogyne cristata, should be grown in quantities for house or conservatory decoration at this season.

FORESTRY.

By J. B. WEBSTER, *Fairview, Stangmore, Dungannon.*

THIS late spell of wintry weather brought planting to a standstill, and the planter will be driven to afford protection to young stuff against the ravages of hares and rabbits. Hollies are particular favourites with these rodents whilst snow lies, and a cheap and efficient method of protection against them is to fasten a handful or two of Heather or small branches around the stem with a withy or tarred string. I have practised this method for many years in woodlands, and have found that it affords good protection to the trees at a trifling cost. Young Oak trees and standard Laburnums, both of which get punished by hares and rabbits, may be protected in the same way. Ornamental trees, however, in open conspicuous places had better be protected with wire netting in the most effectual manner. Newly-formed plantations of young plants may be protected during a storm by carting a quantity of green Fir and other branches [Rough hay. ED.], and spreading them out here and there along the margins of the plantations, which attract the hares and rabbits, which at once commence to eat the spines and peel the branches, and as long as these last not a plant in the plantation will be nibbled. As soon as the snow has melted, the plants may be considered to be safe, and artificial feeding may be stayed, the peeled branches removed and used for any other purpose. Ornamental trees, if likely to suffer from wind-waving, should be staked and fastened till such time as the roots have taken to the soil, and it is sometimes advantageous on exposed land to erect a shelter screen of branches of evergreens around the plant or group of plants, as the case may be, and apply a mulching of tree leaves, Fern, or other suitable material. Nothing adds more to the appearance of an estate than well-kept roads, fences, drains, ditches, and suitably-arranged plantations for sheltering the land and for ornament; and these may be said to be the pioneers of all other improvements. This is a time when hands can be properly spared from other work to quarry stone and break it for macadamising roads, forming drains in woods and other purposes. Advantage should be taken of frosty weather to cart heavy materials of all kinds, and in this way save the roads from hard wear. Scour out ditches and water-courses, the excavated soil being utilised in repairing the banks of the same or others that may require it. Prepare land for spring planting by grubbing up any furze or scrub, and in cases where the stuff to be planted is large, holes had better be dug for its reception, the excavated soil being left in the rough at the sides of the holes, where it will be pulverised by frost and wind. In forming plantations for ornamenting, the ground had better be trenched forthwith, and although this will entail expense at the outset, the superior growth of the trees in after years will compensate the outlay; moreover, larger plants may be planted.

THE FLOWER GARDEN.

By T. H. CRASP, *Gardener, Canford Manor, Wimborne.*

TUBEROUS-ROOTED BEGONIAS.—Tubers of these should now be introduced into gentle heat if cuttings are desired. These strike very readily if placed in small pots, filled with sand and leaf-mould, and plunged in a bottom-heat of 70°, but I would not commend this mode of propagation unless the desire is to increase any particular variety, in which case seeds would be useless to a large extent. For bedding and general purposes, I would recommend seeds as a means of increase, and these should be sown in pots or pans of well-drained light sandy soil, which have been afforded previous to sowing a good soaking of boiling water, which will kill all the small worms, moss spores, &c. The seeds sown thinly should not be covered with any soil or sand, or they will fail to germinate, but the pans or pots may be covered instead with bits of glass, and stood in a warm house or frame where a temperature of 65° or 70° is maintained, shading them from the sun. When the plantlets are large enough to be manipulated, they should be pricked off into pans of light leaf-mould, and, as they become large enough, transferred to boxes if they are required for bedding, and to small pots if for indoor decoration. Seeds sown at once, and treated in the above manner, would furnish capital plants by the end of the month of May. The potting of Pelargoniums can now be proceeded with, which will give them time to make good plants before they are wanted in the flower beds. Cuttings of Lobelia, Iresine, Heliotrope, Coleus, Alternanthera, Ageratum, Petunias, &c., may now be put in, or as soon as the old stock plants start into growth, which they soon do when placed in a good heat for a week or thereabouts. Where Fuchsias are required for bedding, the stock plants should now be placed in heat to start them into growth, so as to be able to obtain a good supply of cuttings a few weeks hence. Trained specimens should also be pruned and started, to enable them to make good plants (if used or required) for the flower garden. If such specimens are plunged, pots and all, in various positions in the flower garden, they greatly add to the summer effects.

THE ROCK GARDEN.—In open weather the rock garden should be examined, and rubbish removed, and those plants that may have been displaced by the frost made firm by hand pressure. It is good practice to give the plants, or most of them, a mulching of rich sandy soil before winter sets in, and if this was not done last year, it would greatly improve the appearance of the rockery, as well as being beneficial to the plants, if it were done now: and the greater the degree of tidiness now holding in this department at this season, the more it will show to advantage at a later date. A few beautiful little plants and bulbs, that will soon be coming into bloom, if not already out in very sheltered positions, are Chionodoxa Luciliæ and C. sardensis, Iris reticulata and its var. persica, Snowflakes, Winter Aconites, Crocus, and Snowdrops, which will be soon pushing through the soil; also Dondia Epipactis, a very pretty little alpine perennial not very often seen in gardens, which flowers very early in the year, and looks extremely pretty when in bloom, being in appearance somewhat similar to the Winter Aconite (Eranthis hyemalis). It is a rather slow-growing plant, and should not be disturbed for propagation, excepting in the case of strong healthy clumps, which should be divided in the autumn before growth commences. This thrives best in good stiff loam.

FRUITS UNDER GLASS.

By JAS. WHITTON, *Gardener, Glamis Castle, Glamis, N.B.*

VINERIES.—The severe frosty weather and absence of sunshine experienced during the past few weeks has necessitated harder firing than is desirable, especially where beds of fermenting material have not been employed to assist in maintaining the requisite temperature; consequently, the growth of early Vines is much softer than desired, and therefore great care must be exercised in giving air under these conditions. The sudden outbursts of sunshine so common in the early months of the year put those in charge of fruit-houses to a pretty sharp test, for a few moments' neglect may seriously injure the prospects of the season. Should the weather continue dull and sunless, keep the atmosphere of the early houses moderately dry, and warm enough to keep the air buoyant and fresh. Night temperature, 60° to 65° in mild weather, and 5° less if frosty; during daytime, 10° to 20° higher. It is now time that all preparations for starting Muscats, Gros Colmar, Lady Downes, and such late-keeping varieties, should be completed. We prefer these to be started about the beginning of February, so that they may have a long steady season of growth, and time to have the fruit well matured by the middle of September, which fruit then will keep well through the winter. Keep the Hamburgh vineries from which autumn supplies are desired as cool and airy as possible for a month yet.

MELONS.—The early sowings will require repotting, if the roots are filling the pots. Pot them low down in 6-inch pots, filling the pots with soil when the plants have grown a few inches taller, and keeping them in these until about 12 inches high in preference to planting in beds; for unless under exceptional circumstances, beds of soil at this season are not easily maintained in the congenial condition so requisite for early Melons. Make successional sowings for midsummer supplies during the month of such sorts as are found most suitable and desirable. For supplies towards the end of May and early in June, varieties of Victory of Bath and Best of All types will be found most suitable, as they come quickly to maturity if smartly grown. Sow two or three seeds in 3-inch pots, or, if space be limited, nine seeds in a 6-inch pot, in any moist, warm, light friable soil, and cover with glass to keep off mice, which are very fond of the seeds of nearly all Cucurbitaceæ. It is immaterial whether the pots be plunged or not, provided that a steady moist atmosphere and temperature of 70° to 80° be maintained. The seeds will germinate under such conditions in about a week, and be ready to pot into 3 or 4-inch pots in a fortnight or so. Before potting, see that the soil is nicely warmed, and in a suitable condition as to moisture. The same remarks apply to successional sowings of Cucumbers.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Picksring Lodge, Timperley.*

GENERAL HINTS, ETC.—The severe weather of the early part of January rendered necessary much hard firing, which was injurious to many species, especially Lælia anceps, whose flowers suffer greatly. The flower-spikes of Cymbidium Lowii are well advanced, and should not be allowed to suffer by affording the plants too little water at the root; an occasional watering with some weak manure-water will also help them. For Orchids, I prefer the manure-water from the cow-yard or byres, or that made from cowdung and water. The present is a good time to start a few more Dendrobiums in heat; viz., D. nobile in its many varieties, D. Wardianum aureum, D. crassinode, D. Findleyanum, and D. Ainsworthii and its varieties, Leechianum, and splendidissimum. The prudent grower will be very careful with the watering of these plants for some time yet, too much water at the start being ruinous. Dendrobiums started about the end of the present month bring the finer flowers, and these possess more substance than those on plants which are started earlier in the year; and the new growths go away with more freedom as the days lengthen and the sun is brighter.

THE COOL ODONTOGLOSSUMS.—The leaves and pseudobulbs of these species should be cleaned by sponging them with water and soft-soap; in doing this very needful operation, the small snails which are often to be found in the axils of the leaves, and which are great devourers of the young flower-spikes, should be diligently sought for. The next worst foes are thrips. If the houses of the cool Odontoglossums are kept at the proper temperature, and the moisture of the air is what it should be, thrips will not be very troublesome. Whilst the work of plant-cleaning is in hand, the pots and stages should be cleansed, and a careful watch kept in the evening for snails at feed. About one hour after dark is the best time to look for snails. Do not fumigate this house, as so doing often causes mischief; and any plants which require to be potted or top-dressed should get attention forthwith, Odontoglossums delighting in fresh sweet material, which the fresh roots readily seize upon. Peat and fresh sphagnum moss of good quality should be made use of; and it is a good practice to put the latter into a tub of water for twenty-four hours before using it, small snails and their eggs being then destroyed. Inordinate watering of the plants must be carefully avoided at this season, but on mild days a slight syringing overhead should be afforded, and the stages kept in a well-damped condition. As fast as the deciduous Calanthes Veitchii, rubra, oculata, and lutea, pass out of flower, place them on a shelf in the Mexican-house, where the temperature should not be lower at night than 55°, here letting them remain till growth commences. C. veratrifolia and C. Textorei, now pushing up their flower-spikes, will be benefited by being watered once a week with weak manure-water. Pleiones which were potted last November will now be able to take more water, but much should not be given as yet; and when the new roots begin to run in the new material, encourage them in every way possible. Aërides, Angræcums, and Saccolabiums requiring potting or top-dressing should be taken in hand, employing a mixture of three parts sphagnum moss and one part peat broken into small pieces, and some bits of charcoal or broken brick. In potting them, see that the plants stand in the middle of the pots, and do not injure the roots in the least in so doing; then fill the pot three parts full of clean crocks, with a layer of sphagnum moss above these, then finish off the potful with the above mixture, and encourage the sphagnum moss to grow by pretty constant syringings; this will also help the plants to retain their leaves. The stages that the plants are stood upon should be kept moist. Cymbidium eburneum and C. Lowianum now pushing up their flower spikes, must not be allowed to suffer for lack of water or an occasional dose of weak manure-water. Introduce more plants of Dendrobiums, such as D. nobilis and its varieties; D. Wardianum, D aureum, D. crassinodes, D. Findleyanum, and D. Ainsworthii, should be put into heat, the watering being carefully gauged, as too much water afforded at the start will sometimes ruin the plants. Having a good stock of plants of Dendrobiums, it is easy to have them in flower till the end of the month of May.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

PEAR WALL-BORDERS.—Assuming that all Pear trees have been pruned, tied, and dressed with some kind of insecticide if this was found to be needful, the roots should be assisted with a dressing of rich soil or half-decayed dung, which is only applicable where the borders are reserved solely for the trees, and where such does not obtain, and the borders are cropped, the aids to growth afforded must be where the roots are, probably deep in the soil. In that case, and the subsoil being of gravel or light and unfertile, a wide trench, a good spit in depth, should be dug out where the roots are found to be, replacing this with some rich pasture loam, of a retentive nature; but should the subsoil be clayey or a stiff loam, a compost of light turfy loam, burnt garden refuse, old plaster, road-grit, &c., will be of benefit to the trees. Having a sufficient quantity of this compost, the trenching of the border may be proceeded with. When the roots reach the part of the border containing these substances, the cleaner growth and finer fruit will soon make the fact apparent. These remarks apply to trained trees on the Pear stock, from which our large supplies of fruit are mostly got. Cordons, which are mostly grown on Quince stocks, give excellent results if their roots are restricted by lifting and replanting them biennially or triennially. The borders at this place, having been well made at the first, top-dressings of rich soil only are needed, and we finish off with a thick dressing of burnt refuse, which has the effect of preventing the surface-soil becoming inert and sour by the trampling on to which it is subjected. [The trampling and consequent consolidation of the soil is very beneficial to any tree—fruit or other. ED.]

THE FRUIT ROOM.—In mild weather afford complete ventilation to sweeten the air in the room, and dispel damp; and on wet days have the fruits examined with care for decaying specimens. But little more will be necessary after this examination. At this season very few varieties of Pears are fit for table. I have had, however, a few fruits of Langelier's Victoria, recently given me by a friend, which in quality are equal to good Glou Morceau. It is a Pear that is in season most years throughout the present month.

ARREARS OF WORK.—All kinds of work in this department, which have been delayed by bad weather, must be completed as soon as possible, including pruning, planting, lifting young trees, border-making, &c.

SWEET CHERRIES.—With all arrears brought up to date, push forward the pruning and training of Sweet Cherry trees on walls and fences. Except in soils specially suited to Cherries, there may be much dead-wood to be cut out of the trees, which should be replaced with shoots left at the summer pruning. Sweet Cherries do not produce shoots from the old wood so freely as other fruit-trees, hence the need to reserve as many, or more, than will be needed. Do not remove fruit-spurs which, through bad management, may have become very long, but rather grub up any such trees from year to year, and replace them with young ones, which by proper summer pruning, may be kept well furnished with short spurs for many years. Where possible, give the choicer sorts of Cherries a west aspect, thus affording them shelter from the early morning sun after frosty nights, and the east wind, exposure to which encourages the early appearance of the very injurious black aphis. Postpone the dressing of the trees till the bloom buds are beginning to move, and then dress them, which dressing will carry them through the blooming season. A dressing may consist of soap suds thirty gallons, to which half-a-pint of petroleum is added. This is an effectual and, in most gardens, an easily-obtained insecticide.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Buxted Park, Uckfield*

SHALLOTS.—For early use these bulbs should be planted as soon as the soil is dry enough to be worked, and it should be well manured and deeply dug as for the Onion. To secure large bulbs, select the plumpest and best-shaped sets, and plant in rows 15 inches apart, and the bulbs 6 inches apart in the row, and plant them sufficiently deep to prevent their being lifted out of the soil when the roots start to grow. If the bulbs are covered to the depth of an inch, this will keep them in place, and the soil may be taken from round them as soon as they have become firmly rooted. In ground devoid of lime, a sprinkling of it afforded before the bulbs are planted will help to check mildew, which in districts where lime is scarce, is a very prevalent malady.

GENERAL WORK.—As soon as the frost is out of the ground, seize the first opportunity of the ground being fit to tread upon, to level and dig that which has carried the crop of Celery; no better place being found than this in which to grow this season's Onions; and having already received a liberal dressing of manure, it will be in good heart. I prefer to dig such land two spits deep, after levelling it. The spades used should not be much worn, as the greater the depth which can be moved, the better for the crop. When digging, leave the surface rough, but that which is turned into the bottom of the trenches should be broken up quite fine. If there should be any unexhausted manure at the bottom of the Celery trenches, it should be well mixed with the soil while digging it. The advantages gained by leaving the surface in a very rough state are two-fold; in the first place, it allows the drying winds to penetrate to a considerable depth, and as a dressing of lime, soot, or other artificial manure will be given previous to forking the ground over at the time of sowing the seed, it will be readily mixed with the soil. Celery rows that were heeled over previous to the setting-in of the frost, should only be uncovered, as they are required for use, even if the weather be mild, as the air which then reaches the hearts tends to rot the plants.

FORCED VEGETABLES.—Carrots and Turnips on hot-beds that are quite in the rough leaf, should be thinned so as to prevent spindling, and with mild weather more air should be admitted on all favourable occasions. Do not cover the lights with mats or other coverings at night, unless actually compelled by frost so to do, and then not till after dark, as this covering up during the hours of sunshine tends to spindling or drawing of the plants. It also checks the ingress of air through the laps of the glass. When obliged to resort to covering up, remove the mats, &c., as early in the morning as possible.

PEAS in pots or in heated pits must receive great attention; for if allowed to become dry at the roots, they will be liable to attacks of mildew. Those far enough advanced should have some slight sticks put to them to support the haulm, and prevent it from being knocked down. If the plants are crowded, thin them, as nothing is gained by crowding forced vegetables. Those in rows 18 inches apart, should have at least a space of 3 inches between each plant in the row.

SMALL SEEDS.—Such seeds as those of Brussels Sprouts, Cauliflower, Lettuce, and Early Cabbage that were sown on hot-beds a month ago, will be large enough for pricking out on to other hot-beds. It is a good plan to get this done while they are in a small state, the danger of spindling or losses from damp being then much less.

FRENCH BEANS.—Make a successive sowing, and if heated brick-pits are available, a sowing may be made in these, as the crops will be taken before the pits are required for Cucumbers or Melons. Thin out those sown a month ago, so that the plants have sufficient space to grow robust. If in pots, more water will be required by the plants as the days get longer, and they should be frequently syringed to keep down red-spider.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

LOCAL NEWS.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

ILLUSTRATIONS.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, FEB. 2—Linnean Society.

FRIDAY, FEB. 3—Annual Meeting of the Gardeners' Orphan Fund, the Election of Orphans, &c., at Cannon Street Hotel, at 3 P.M. Dundee Horticultural Society.

SALES.

MONDAY, JAN. 30—Roses, Lily of the Valley, and Other Plants, at Protheroe & Morris' Rooms.

TUESDAY, JAN. 31—Established Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, FEB. 1—Japanese Lilies, Begonias, Pearl Tuberoses, Azaleas, Ferns, &c., at Protheroe & Morris' Rooms.

THURSDAY, FEB. 2—Special Sale of Hardy Border Plants and Bulbs, Roses, Pæonies, &c., at Protheroe & Morris' Rooms.

FRIDAY, FEB. 3—Orchids from Messrs. F. Horsman & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°.

Germination under difficulties.

ONE of the best methods of preserving the vitality of seeds during long journeys is to pack them in charcoal, earth, or sand. Some species require a moist material in which they can germinate on the voyage, and some cannot preserve their vitality unless introduced in a germinating condition. Seeds, or rather, seedlings, thus developed do not succeed well on their arrival if the stage of germination is far advanced, or if they are not furnished with reserve stores of nutriment, as in the perisperm or fleshy cotyledons. Seedlings in an advanced state of germination, and those which have small blanched leaves, are considered as hopeless. Such plants, says M. CORNU (the director of the Jardin des Plantes), which have germinated in darkness during the voyage invariably perish, no matter in what way they are treated. In order to overcome this difficulty, and to preserve seedlings that have germinated in closed cases, M. CORNU has hit upon the following method, which he describes in a recent communication to the Academy of Sciences. The seedlings, often thread-like in character, are carefully picked over, and separated from one another. Those which are bruised or otherwise injured are thrown aside, whilst the uninjured seedlings are placed on a layer of Orchid peat, formed from the breaking up of the roots of Polypody. This substance is porous, sweet, not liable to attack from fungus-moulds, and condenses the moisture of the air. The plants thus placed on the peat are covered with a bell-glass, and kept at a temperature of 25° to 30° C. = 77° to 85° F., and slightly shaded. So treated, the weak, blanched seedlings recover their vitality, the leaves become green, new roots are produced, and the plants become fit, after a time, to be grown in the ordinary way. Sphagnum it appears has not the same effect.

M. CORNU gives numerous illustrations to show how valuable this simple method is in the case of seeds which have commenced to germinate during the voyage, and which otherwise would perish irrevocably.

It would be interesting to see what would be the effect of packing the seeds themselves in peat as is now done in charcoal. We are not aware that this has been tried. As peat of this character might not be available on the spot, a supply might be sent out without difficulty, as the quantity required would be but small.

Hampton Court Home Park.

SHOULD the efforts now being put forth by various local authorities and members of parliament in the neighbourhood of Hampton Court be successful, and the noble Home Park be thrown open, the public will enter upon the possession of a very splendid domain, indeed, one of the finest and most delightfully-situated parks round London. Reputably the park is of 1000 acres in extent. That area must, however, be inclusive of Hampton Court gardens, paddocks, and the whole of the land that lies between the river Thames from Kingston Bridge to Hampton Court Bridge, and the high road from bridge to bridge. Between these channels of communication, which thus bind Middlesex to Surrey, the river takes a long and sweeping bend of some 3 miles in length, the Home Park boundary following the Middlesex side of the Thames. From the palace-end there radiate in the direction of Kingston, Surbiton, and Thames Ditton, three very broad noble avenues of Limes, each of four rows of trees, and at the extremities these are nearly united by another long broad avenue running transversely. Thus, at the outset, the park is found to include very noble features. Between the double tree rows of the centre avenue runs the Longwater, recently one sheet of ice, over which thousands of persons have skated in the most delightful fashion. This splendid sheet of water is about 100 yards wide, and nearly three-quarters of a mile long. If available to the public, it might prove a most attractive resort, or from a garden aspect be most delightfully ornamented by planting the banks with suitable vegetation. That would, of course, render the enclosing of the sides needful. At present, however, the park seems to maintain only a few brood mares and foals, and cannot in any way be profitable to the government. Whilst it would be undesirable to make carriage roads or other than a few gravel or coal ash paths, the formation of a bold drive on the river margin from the one bridge end to the other, passing out at the palace end on to the tow-path, would be a most popular act; indeed, the conversion of this grand park into a place of public resort would serve to make Hampton Court one of the most popular public gardens in the world. During hot summer weather tens of thousands of visitors to the palace have gazed longingly into the deep shady recesses of the Lime avenues, so cool and so enjoyable, with envious desire. There are in the parks some features that would, however, need some protection. There are the huge hollow trunk of the father of the park, an Oak that has probably existed 1000 years, and some probably equally old; and remarkably fine as well as picturesque trunks of Elms. The Oak trunk has internally a clear diameter of 9 feet, and externally measures in its narrowest part, 4 feet from the ground, 36 feet round, whilst at 6 feet it is probably some 40 feet. The thick shell of bark carries yet many very robust branches, and if well-cared for, the tree would no doubt endure for 100 years longer. Last year it was in some careless way set on fire, but although the inner surface was charred, the tree was saved from much harm. One of the Elms has a girth of about 25 feet, and is tall and in vigorous growth. Another stem of the same girth is a noble ruin, having been broken clean off at 9 feet from the ground. Several others have girths of 21 feet, and one or two quite dead are the most strange-looking and picturesque objects conceivable. These should be preserved with all honour so long as is possible.

RAILWAY RATES.—We gladly publish the following letter on this subject:—"At a meeting of the London Wholesale Seed Trade Association, held on Jan. 20, present, Messrs. WATKINS & SIMPSON, Exeter Street, Strand; RUTLEY & SILVERLOCK, Victoria Embankment, W.C.; HURST & SON, 152, Houndsditch, London; JACOB WRENCH & SONS, Limited, London Bridge, E.C.; COOPER, TABER & Co., Limited, 90, Southwark Street, Borough; NUTTING & SONS, Southwark Street, Borough, the new Railway Rates were considered, and it was resolved that I, as chairman, be requested to urge upon you:—(1.) That the new rates and regulations will, if continued, seriously impede the business transactions of the firms composing our association, by driving the outward trade from London, and their inward or farmer's produce trade to other countries or districts where communication by water is available. (2.) Supplying, as we do, indirectly the agriculturists of the United Kingdom with seeds for their farms, a class which is already most seriously overburdened, we submit that the rates, instead of being advanced, should most certainly be reduced to the lowest possible tariff. (3.) That one or more of the members of our association will be pleased to wait upon you by appointment to discuss the matter more fully.—A. WATKINS (Chairman)."

—— "So far as I see," writes Mr. W. BAYLOR HARTLAND, of Ard Cairn, Cork, "this new railway rate scale will cripple the agricultural work of our purely agricultural country. First.—Freights on seeds have to be paid for large lots in all parts of the world by rail or steamer. Afterwards, for redistribution at seed time, the same supplies get cut up into small quantities, and sometimes a double or a treble freight paid on them, there are so very few farmers in Ireland who require a two-ton lot of Clover seed. It has to be cut up into very small portions, often into 160 stones, or double this. Take, for instance, one ton of Flounder Potatos from Athlone to Cork first costs £5 or £6. This could be had last year at Cork station freight, 14*s*. Last week I paid for a sample ton 23*s*., nearly 75 per cent. advance in freight alone. Now, this ton of seed got redistributed in three days from warehouse, in small lots, weights, half-hundredweights and hundredweights, and sent by rail or tram from Cork, and I suppose no lot will be delivered at destination under 1*s*. 6*d*., 2*s*. 6*d*., or it may be 3*s*. additional railway charges, thus, according to the new system, running the cost up, on freight alone, to the consumer 150 or more per cent. This is but a case with a ton of Potatos. But, as I mentioned in the case of Clover, all seeds come to Cork, not as food to be consumed within the city, but for redistribution in the farming districts; and that when railway companies charge a double freight on agricultural seeds, above all other things, the classification should be low accordingly, more particularly with some lots. Why, the germs (like gold dust) of the Champion Potato, thirty years since, in the hands of an enthusiast in Forfarshire, Scotland, made thousands of pounds in freight for the railways and steamers of the United Kingdom, and, indeed, by its introduction to this poor country of ours saved millions for both governments, and kept Ireland from

starvation. Good grass is but sowing down Ireland to permanent pasture, so that any way by which we frustrate the design of introducing good seeds in small quantities into our common country, we are but injuring the cause of God and man alike, and I hope the public and the railway kings will see that small lots of agricultural seeds get fair play over the railways of Ireland."

—— Meetings all over the country are being held to protest against the exorbitant rates now levied. Market gardeners and fruit and flower farmers will be among the chief sufferers, and the growing fruit industry runs a good chance of being strangled in its birth. The Spalding Improvement Commissioners report that in the case of Cabbages, the extra rates from Lincolnshire to London amounted to as much as £8 10*s.* per acre, and that the rates from Lincolnshire to Sheffield for hay and straw were nearly doubled. We should be glad to hear what our nurserymen have to say upon the subject.

—— A conference of traders and agriculturists on the subject of the new Railway Rates will be held at the Mansion House on Monday, the 30th inst., at half-past 2 o'clock, under the presidency of the Lord Mayor. The meeting will be addressed by Sir James Whitehead, and other Members of Parliament. Application for tickets of admission should be made to the Secretary of the Mansion House Association on Railway and Canal Traffic, Eastcheap Buildings, who will also upon request, supply forms for comparing the old and the new rates. In the meantime, the President of the Board of Trade, and his colleague of the Board of Agriculture, bid us wait with patience.

Fig. 18.—The rockery at Madresfield Court. (see p. 100)

Ghent Quinquennial.—We have received a copy of the schedule of this exhibition, which promises to be of even greater importance than usual. In all 660 classes are mentioned, and in each class two, or in some cases, three prizes are offered. The jury will be international in character, and no inhabitant of Ghent is qualified to act as juryman. Two British prizes will be offered, viz., the Van Houtte Memorial Prize for forty miscellaneous plants in or out of flower, and the Veitch Memorial Prize mentioned in our last issue.

Linnean Society.—At the general meeting held on Thursday, January 19, Professor Charles Stewart, President, in the chair, the President referred in suitable terms to the losses sustained by biologic science in the deaths of Sir Richard Owen and Professor J. O. Westwood, who had been Fellows of the Society for fifty-six and sixty-four years respectively. Mr. W. Carruthers, F.R.S., V.P.L.S., then laid before the Society the results of a collection made by Mr. Alexander Whyte in the Malanji country, in the Shiré highlands, in October, 1891, and of which the plants were determined by the officers of the Botanical Department, British Museum; about sixty, or, roughly speaking, one-fifth, proving new to science. Whilst Sir J. D. Hooker defined the flora of Kilimanjaro as Abyssinian in character, the Malanji flora displays a much closer relationship to the Cape. The last paper was by Mr. G. F. Scott-Elliot, and was his report as botanist to the Anglo-French Sierra Leone Boundary Commission, in which he gave an account of the economic aspects of the districts traversed. An evening meeting will be held on Thursday, February 2, 1893, at 8 p.m., when the following papers will be read:—1. Report on the Entomostraca from the Gulf of Guinea, West Coast of Africa,

collected by J. RATTRAY; by THOS. SCOTT, F.L.S. 2. Two new species of Rhax; by H. M. BERNARD. 3. On the Division of Nuclei in the Mycetozoa; by ARTHUR LISTER, F.L.S. 4. On the structural differentiation of the Protozoon Body, as studied in microscopic sections; by J. E. S. MOORE.

THE SEED TRADE.—The past autumn proved one of the worst known for years for ripening some of the Legumes. Only a few days ago, we were shown some samples of green Windsor and white Beans, which, after being harvested and stacked as usual, had just been thrashed out, and what Beans were sound were much discoloured, many quite rotten, and all very soft, needing two or three weeks' drying at least to harden them before they can be sent out. This is common experience, and illustrates the great difficulty experienced by the wholesale seedsmen in executing their orders. A sample of Autocrat Peas would not pay for picking, and other late sorts are similarly affected. It is only those who are engaged in the business of seed-growing that can understand something of its anxieties and worries. The difficulty of getting off orders is acutely felt this winter.

TECHNICAL EDUCATION. — Mr. KNIGHT has finished a first course of thirty lectures on behalf of the East Sussex County Council. The attendances throughout have been very good. Cottagers chiefly were supposed to derive most benefit, but last year many gardeners attended, and it is to be regretted that this year but few of the former put in an appearance, though some audiences were composed almost exclusively of gardeners. This seems to point to the fact that they at least do not object to learn, and are not above being taught when the knowledge is conveyed in an interesting and entertaining manner. That great good is now being done we are quite confident.

FRUIT FROM THE CAPE.—A consignment of fruit from South Africa arrived at Southampton on the 22nd inst. by the Union Steamship Company's R.M.S. "Athenian," consisting of 334 packages of Apricots, 27 boxes of Peaches, and 2 boxes of Pears, from Cape Town; and 183 cases of Mangos and Pines from Durban. The Peaches and Apricots arrived in condition not quite satisfactory, and consequently realised less than was anticipated. The Pines were the smallest that have been seen at Covent Garden Market for some time, and fetched from 5*d*. to 9*d*. each only. Mangos also were unsatisfactory.

THE SHOW-HOUSE AT KEW.—The show-house, No. 4, is gay with bright flowering plants. Among them may be mentioned Hyacinths, Narcissus, Lily of the Valley, Cyclamen, Epacris, Chinese Primrose, Freesias (very well done), and Camellias, with the black-green leaves, indicative of health. All these are very nice, but may be seen anywhere. As less common and more interesting, and, therefore, more what one seeks at Kew, we may mention the vividly-coloured Peristrophe speciosa, Strobilanthes isophylla, an old friend, rarely seen now-a-days; various greenhouse Rhododendrons, with brilliant-coloured flowers, and whose long lithe branches have to be tied down as if the plants were climbers. Daphne Genkwa bears a most wonderful resemblance to a Lilac (Syringa). The resemblance is, of course, merely superficial, and transcendentalists could in this case hardly sustain a charge of mimicry against either plant; Reinwardtia or (Linum) trigynum is very effective. The Freesias above mentioned are interesting, as affording illustrations of regular peloria. The normal flowers are slightly irregular, the two lower perianth segments of the inner row more or less deeply blotched with yellow. The three stamens are arranged in a sort of hood in the upper half of the flower, arching over the blotch, so that an insect alighting on the flower, and guided by the yellow blotch, would wipe out the pollen from the anthers, and convey it to another flower, where the three-branched stigma was projecting to receive it; but in the white variety the flowers are nearly regular, with no blotch in the tube, and the three stamens are arranged around the style in a circle. All intermediate stages may be met with.

THE "ROSARIAN'S YEAR BOOK" opens with a portrait of the Editor, the Rev. H. H. D'OMBRAIN, of whose career the Dean of ROCHESTER writes a sympathetic account. Seven well-known rosarians gossip about Tea Roses; the Editor supplies some reminiscences of French rosarians. Mr. GRAHAME raises the question of deterioration in Roses, which we are interested to find he does not attribute to the Rose itself, but to the unfavourable conditions under which they are grown, or the faulty treatment they receive. Mr. ALEXANDER GRAY is as full of fun as usual; and Mr. MAWLEY's notes on the weather of the past year constitute a particularly valuable contribution, applicable not only to Roses, but to any and all plants grown in the open air.

UNIVERSITY OF PENNSYLVANIA.— The first number of a periodical entitled *Contributions from the Botanical Laboratory of the University of Pennsylvania* has reached us. It contains teratological articles by Dr. ROTHROCK and Mr. HARSHBERGER; a note on the staminal arrangements of Epigæa repens, a nascent variety of Prunella vulgaris, a dwarf form, which most of us have seen on our lawns, and which is a good illustration of the powers of adaptation to —lawn-mowers! and which is of interest to those who study the effect of environment on plants. Dr. ROTHROCK should obtain seeds from this variety, and note if the "nanism" is reproduced in the offspring—probably not, we should say. Dr. WILSON also contributes a paper on the leaves of Melilotus alba, which assume different positions according as they are exposed to ordinary daylight, to darkness, or the rays of a hot sun, the latter position being assumed to prevent a too rapid transpiration, and are not dependent on light alone, but on heat and water supply. Dr. MACFARLANE, late of Edinburgh, now the Director of the Laboratory, contributes an important paper on the Venus' Fly-trap, Dionæa Muscipula, dealing with the phenomena of leaf-closure, leaf structure, leaf secretion, leaf opening, and "irrito-contractility." The hairs of the Fly-trap are multicellular, and have a hinged joint near the base, consisting of numerous quadrangular cells, devoid of cuticle, and each minutely pitted, the pits, presumably, being pervious, though this is not yet decisively made out. We cannot give the structural details at greater length, suffice it to say that the passage of protoplasm from cell to cell is well marked, if the leaves are treated in a particular manner detailed by the author. The paper cannot be fairly dealt with in abstract, but must be studied as a whole.

THE GARDENERS' ORPHAN FUND.—The usual monthly meeting of the committee took place at the Horticultural Club, Hotel Windsor, Victoria Street, on the 20th inst., Mr. WILLIAM MARSHALL presiding. The special amounts announced by the Secretary were—H.R.H. the Princess of WALES, £10 10*s*.; the Scottish Horticultural Association, £5; Mr. H. Herbst, £1 1*s*.; the Ware Horticultural and Mutual Improvement Society, £1 11*s*. 6*d*., and Mr. W. Whittaker, Stocklands, Bridgewater, 10*s*. The following sums from boxes were also announced: —G. Fennell, Fairlawn, Tonbridge, 10*s*. 6*d*.; and Mr. H. J. Jones, Ryecroft Nursery, Lewisham, £2 10*s*. 6*d*. With the letter enclosing the cheque for 10 guineas from the Princess of WALES came one from Col. Stanley Clarke, the private secretary to H.R.H., stating that in reply to a request made through Mr. John Wills, H.R.H. permitted her name to be announced as the patroness of the Fund. The following resolution was unanimously passed: —"That the best thanks of the committee be given to Mr. John Wills, for the invaluable services rendered to the Gardeners' Orphan Fund in securing the influential support of H.R.H. the Princess of WALES as the Patroness of the Fund." Mr. John Wills, in acknowledging the same, suggested that a special circular, setting forth the fact of the Princess of WALES having become the Patroness of the Fund, be sent to a large number of the nobility and gentry of the country, with a view of securing their support also. This was agreed to, and a sub-committee was appointed to prepare the same. An application was made on behalf of a boy who, by reason of reaching the maximum age, had ceased to benefit from the Fund, as to whether the committee could make a grant to complete his education. The committee decided it would be exceeding their powers were they to do so. Enquiry was also made as to whether the child of a subscriber of seven or eight years' standing could be placed upon the Fund without the necessity of election. The Secretary was instructed to reply, that admission to the Fund could be made only by election in the usual way. A donation of £5 from Mr. G. Cooke was announced.

WINTER-FLOWERING BEGONIAS.—It is true that there are many very pleasing winter-blooming Begonias in cultivation; still, none have hitherto been seen that in any way caused so much interest or admiration as Gloire de Sceaux, shown in such grand form at the Drill Hall on the 17th inst. To very many of those present it appeared to be absolutely new, although some time in commerce, but without doubt it was largely the superb way in which it was presented by Mr. JENNINGS that led to such impression. Not only did that gardener deserve the highest award that could be made to him for his exhibit, but he merits in no less degree the thanks of lovers of winter Begonias, for having thus shown how finely they can be grown and flowered. Naturally the question arises, Why should we continue to devote so much attention to the summer-blooming Begonias, of which we have varieties to repletion, when it is evident that here, in the winter-blooming race, is a field open to raisers which is beyond all others worth cultivating? What a grand strain of winter varieties might be evolved from out of Gloire de Sceaux, especially if its fine bronzy foliage be retained! We need now flowers of double the size, and of pure white, pink, red, yellow, crimson, and other beautiful hues. Would it not be of greater service to floriculture to strive for the production of such a strain, than to farther waste effort in the development of the summer forms, which have flowers large enough and double enough to satisfy the most exacting? What good to any one will result from the getting of larger flowers? On the other hand, the wider development of these winter-bloomers would open up a field which should prove enormously productive. There are thousands of gardeners who would gladly possess superior winter-flowering varieties.

PUBLIC PARK FOR RAMSGATE.—The design of J. CHEAL & SONS, Crawley, for laying out the grounds of Ellington House as a public park has been accepted by the council, and the contract for carrying out the work has been entrusted to them. The grounds comprise about 13 acres. In a subsequent issue we shall give the plan of the new park.

NATIONAL CHRYSANTHEMUM SOCIETY.—We are requested to announce that the annual general meeting of members of the above will take place at Anderton's Hotel, Fleet Street, on Monday, February 20, at 7 P.M., of which notice will be given to the members in due course.

BOURNEMOUTH AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—At the fortnightly meeting of the above on Wednesday, January 18, Mr. C. W. HERBERT GREAVES gave a lecture on "The Potato and Tomato Disease." Having sketched in a somewhat detailed manner the life-history of the Phytophthora infestans, the lecturer proceeded to show how a full knowledge of the habits and various methods of reproduction of the fungus was of practical value in suggesting means of prevention. The methods of prevention were arranged under two heads, viz.; (*a*) those applicable to the

Potato only; and (*b*) those common to the Potato and the Tomato. The experiments that have been tried in various countries with Bordeaux Mixture were dealt with as fully as time permitted. The lecture was illustrated by diagrams, and was listened to attentively. Mr. WATTS, Junior, of the Palace Nurseries, was in the chair. An interesting series of lectures will also be given during the year, the particulars of which can be obtained from Mr. J. B. STEVENSON, Secretary. According to the published balance-sheet, the Association possesses a balance at its bankers of £11 15*s.* 3*d.*

THE LATE MR. JAMES SHEPPARD OF WOOLVERSTONE.—A man of great ability, and a skilful and practical horticulturist, whose heart and soul were in his profession, passed away on the 16th inst., as was noticed in our previous issue, in the person of Mr. JAMES SHEPPARD. He had been for the last thirty-six years in charge of the gardens at Woolverstone Park, Ipswich, having previously acted as foreman at Longleat. Woolverstone has recently passed into the hands of C. H. BERNERS, Esq., who succeeded his father, the late Captain HUGH BERNERS, R.N., and is one of the largest and most beautiful estates in Suffolk, as it extends for many miles along the banks of the River Orwell. During the period that Mr. SHEPPARD was gardener he carried out many important alterations and improvements, and the whole place is characteristic of the state to which the art of modern gardening can be brought by a skilled operator. Mr. SHEPPARD had an abhorrence of anything artificial in the planning of pleasure-grounds or gardens, and that he was master of the art of landscape gardening, is indicated in many directions. The heating arrangements of the houses are the work of his hands, as also the water supply to the garden and village forced up by rams a mile or so distant. Mr. SHEPPARD was for more than a quarter of a century a contributor to the columns of the *Gardeners' Chronicle*, served on the Fruit Committee of the Royal Horticultural Society, and yearly performed the office of judge at the leading metropolitan and local shows. He was also well-known as an exhibitor, especially in classes for fruit, and was an adept in the art of Grape growing. He was last winter selected by the Technical Instruction Committee of the East Suffolk County Council to lecture on Horticulture, but was stricken with his fatal illness, cancer of the stomach, before being able to quite complete this season's course of instruction. Personally, firm in discipline towards those under his control, he was always ready and anxious to do all in his power for their advancement or good. Kind-hearted and genial to a degree, and considerate and thoughtful for others, he endeared himself to every one with whom he came in contact. He was held in the highest esteem by his employers, from whom he received many marks of approbation. The funeral took place on Friday last, amidst every sign of widespread sympathy and regret.

WOOLTON GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—The annual meeting of this Society was held on the 19th inst., Mr. B. CROMWELL of Cleveley Gardens, Allerton, presiding. The statement of the year's work was very satisfactory. Special thanks are tendered to Mr. E. G. BAILLIE, Chester, for his lecture on Vegetarianism; and to the Rev. G. H. SPOONER, Mr. J. DAVIES, and the proprietors of the *Journal of Horticulture* for special prizes, the successful competitors being Messrs. A. ROWLANDS, W. DISLEY, H. CORLETT, and J. J. CRAVEN. A "floral concert" realised the sum of £12, which has been equally divided between the Gardeners' Royal Benevolent Institution and the Gardeners' Orphan Fund. Gifts have been made to the by library Mr. HOLBROOK GASKELL, J.P., the President; Mr. R. J. HARVEY GIBSON, M.A., F.L.S., and Messrs. JAMES VEITCH & SONS. Special lectures, under the auspices of the Lancashire and Cheshire Association for the extension of University Teaching have been given under the management of this Society, that in the spring by Mr. R. J. HARVEY GIBSON, M.A., F.L.S., lecturer on botany, Liverpool University College, on the Geographical distribution of Plants, illustrated; and in the autumn Dr. T. L. BAILEY delivered a course on the Chemistry of Soils, with experiments and illustrations. The finances are in a healthy state, the balance in favour of the Society being £3 9*s.* 3*d.* The Secretary, Mr. W. DISLEY, and the Treasurer, Mr. R. G. WATERMAN, were re-elected. A special course of lectures was announced on the "History of Botany and Agriculture," for the spring session, by Mr. R. J. HARVEY GIBSON, M.A., F.L.S.

GRASSES OF THE PACIFIC SLOPE.—Dr. VASEY, of the United States Department of Agriculture, Botanical Department, has published the first part of a valuable series of descriptions and figures of the grasses of the Pacific States of North America. There are about 200 species, all, it is said, distinct from those which grow east of the Mississippi. The work will assuredly be of great value not only to botanical students, but to all persons interested in agriculture and the rearing of domestic animals. Dr. VASEY acknowledges the great assistance rendered him by his assistant, Prof. L. H. DEWEY. The illustrations are very clear.

JAMES CARTER & CO.—ROBSON'S *London Directory* for 1837, then in its seventeenth edition, contains an advertisement of JAMES CARTER, who announces his removal from Drury Lane, to 238, High Holborn, opposite DAY & MARTIN'S. There is no opposition now, for JAMES CARTER & Co. at present occupy the premises once consecrated to blacking. At that time forty-two seedsmen were enumerated. Most of the names in the earlier edition are not represented now-a-days, but we still find the names of CARTER, NUTTING, GIBBS, and WRENCH.

THE LATE SIR JAMES WM. MACKEY'S BUSINESS.—We understand that the family of the late Sir JAMES W. MACKEY of Dublin, in accordance with his wishes, will continue the seed business—founded in 1777—under the management of Mr. A. O. WATKINS, who ably conducted it for Sir JAMES during his long illness.

SHROPSHIRE HORTICULTURAL SOCIETY.—This successful society have recently purchased for £3150 some fields adjacent to the show ground, and hope to continue the promenade to the same, and plant trees and generally decorate the land acquired.

THE MIDLAND CARNATION AND PICOTEE SOCIETY.—We have before us the second annual report of the above, from which we are enabled to gather the following facts concerning its condition since the issue of the first report. The appeals for support have been generously responded to, and the number of members has risen from 152 in 1891 to 204 in 1892, and 20 others have joined since the present year began. The second annual exhibition at the Botanical Gardens, Edgbaston, Birmingham, on Saturday, August 16, was held on favouring circumstances of weather, was very successful, and was very well attended by the inhabitants of Birmingham and the vicinity. The success which has attended the Society's shows has warranted the committee in making a donation of £5 each to the Gardeners' Royal Benevolent Institution and the Gardeners' Orphan Fund. The balance which the Society has at its bankers amounts to £32 6*s.* 4*d.*

ORIGIN OF PERFUME IN FLOWERS.—In the *Comptes Rendus* for November 21, M. E. MESNARD details the result of his experiments relative to the mode of production of perfumes in flowers, and the following are the conclusions at which he arrives:—"1. The essential oil is generally found in the epidermal cells of the upper surface of the petals or sepals. It may occur on both surfaces, especially if the floral segments are completely covered in the bud. The lower surface usually contains tannin or pigments, which are derived from it. 2. Chlorophyll seems invariably to generate essential oil. This is comprehensible if it be remembered that usually the floral segments are only modified leaves which are fulfilling a new function. The chlorophyll is then found diverted from its usual purposes, and modified sometimes into persistent tannin-like substances, sometimes into essential oils. 3. Exhalation of perfume from the flower is only discernible when the essential oil is sufficiently differentiated from the intermediate products from which it is generated, and it is found in inverse proportion to the amount of tannin and pigment in the flower. This will explain why flowers with green petals are scentless, and why white and rose-coloured flowers are most often odoriferous; why Composites that are rich in tannin, have often so unpleasant an odour; and finally, why forced white Lilac and Roses develop a most delicate perfume." But all green flowers are not scentless, witness the Vine, or the "Ilang-Ilang."

LITERATURE AND GARDENING.—Referring to a paragraph which appeared in an evening contemporary the other day, regarding a lecture by Mr. JOSEPH HATTON on "Novels and Novelists," that gentleman writes:—"It was not intended to suggest that Mr. BLACKMORE is simply a market gardener. I mentioned this occupation as work which the novelist likes, and not as a labour of necessity. In doing so, I compared Mr. BLACKMORE with another distinguished and delightful author, 'Ik Marvel,' whose *Reveries of a Bachelor* is one of the most sweetly human books of the century. Mr. BLACKMORE, it is said, would rather talk of horticulture than books. 'Ik Marvel' (DONALD E. MITCHELL), being interviewed by a New York reporter, said, 'Talk to me about planting Parsnips, but don't ask me about my books.' The anecdote which you printed," adds Mr. HATTON, "was related to me by a friend. Quoted without the context it conveys a different meaning from the point which it illustrated. Greatly admiring the author of *Lorna Doone*, I should deeply regret if any reader should have gathered from your paragraph any other impression than one of respect for Mr. BLACKMORE and his work. It is related of a certain critic of horticulture that he slightingly noticed Mr. BLACKMORE'S views upon some question of gardening to mention the fact that 'he also writes books.' I mentioned Mr. BLACKMORE'S gardening as a wayside incident of his brilliant career as a novelist."

GARDENERS' ROYAL BENEVOLENT.—In our notice of this institution last week, the list of selected candidates was taken by us from the *Journal of Horticulture* without comment, under the impression that it was the official list communicated by the Secretary. We now learn that this was not the case, and can only express our regret that we should, even inadvertently, have omitted to state the source whence our information was derived.

GLASGOW BOTANIC GARDEN AND PARKS.—APPOINTMENT OF CURATOR TO BOTANIC GARDENS.—From a Glasgow correspondent we learn that at a meeting of the Parks Committee, it was agreed to recommend the Town Council, at a meeting on Thursday next, to appoint Mr. DANIEL DEWAR, foreman of the herbaceous department of the Kew Gardens, London, as the Curator of the Botanic Gardens. It was thought inadvisable, as at first proposed, to join the duties with that of Superintendent of the Parks, hence the Parks Committee also agreed to recommend the appointment of Mr. JAMES WHITTON, at present gardener to the Earl of STRATHMORE, Glamis Castle, as Superintendent of the Parks. The salary attached to the office is £300 per annum.

LIVERPOOL.—Curator, J. Richardson.

MANCHESTER.—Botanic Garden: Curator, Bruce Findlay.

OXFORD.—University Botanic Garden: Professor, Dr. Sydney H. Vines, F.R.S., F.L.S.; Curator, William Baker; Sibthorpian Professor, Dr. J. H. Gilbert, F.R.S.

REGENT'S PARK.—Royal Botanic Society: Secretary, W. Sowerby; Curator, W. Coomber.

ROYAL COLLEGE OF SCIENCE, LONDON.—Professor of Botany, J. B. F. Barber; Professor of Agriculture, J. Wrightson.

ROYAL HORTICULTURAL SOCIETY, 117, Victoria Street, Westminster.—Secretary, Rev. W. Wilks; Assistant-Secretary, J. Weathers. Garden Superintendent, Chiswick, A. F. Barron.

LINDLEY LIBRARY, Royal Horticultural Society, 117, Victoria Street, London, S.W. (Trustees).—Available to the public on application to the Secretary.

SHEFFIELD.—Curator, W. Harrow.

ST. ANDREWS, N.B.—Dr. Wilson.

SWANLEY, KENT.—Horticultural College: Director, F. Bond.

INDIA AND CEYLON.

CALCUTTA.—Department of Royal Botanic Gardens, Seebpore: Superintendent, Dr. George King, C.I.E., LL.D., F.R.S., F.L.S., Director of Botanical Survey of India; Curator of Herbarium, Dr. David Prain, F.L.S., F.R.S.E.; Curator of Garden, Robert L. Proudlock; Assistant, G. T. Lane.

AGRA.—Taj Garden: Superintendent, A. B. Westland.

ALLAHABAD.—Superintendent, J. Phillips.

ALIWAL.—Garden: Curator, P. Brown.

BANGALORE.—Government Botanic Gardens, Lal Bagh: Superintendent, John Cameron, F.L.S.; Head Gardener, J. H. Stephen.

BARODA.—Superintendent, J. M. Henry.

CAWNPORE.—Assistant-Director in charge of Experimental Station, G. H. T. Mayer.

CEYLON.—Department of Royal Botanical Gardens: Director, Dr. Henry Trimen, F.R.S., F.L.S.—Peradeniya: Head Gardener, Peter D. G. Clarke; Clerk and Foreman, J. A. Ferdinandus; Draughtsman, W. de Alwis.—Hakgala: Superintendent, William Nock.—Henaratgoda: Conductor, A. de Zoysa, Muhandiram.—Anurâdhapura: Conductor, S. de Silva, Arachchi.—Badulla: Conductor, D. Guneratne.

DARJEELING.—Lloyd Botanic Garden: Curator, William A. Kennedy.—Agri-Horticultural Society of India: Secretary, J. Blechynden.

GHORPURI.—Botanical Station: Superintendent, A. R. Lester.

GWALIOR.—Superintendent, C. Maries.

LAHORE.—Superintendent, J. Phillips.

LUCKNOW.—Superintendent, M. Ridley.

MADRAS.—Botanical Department.—Ootacamund: Government Botanist and Director of the Government Cinchona Plantations, M. A. Lawson, M.A., F.L.S.; Curator, A. Jamieson.—Madras Agri-Horticultural Society: Secretary, Colonel H. W. H. Cox; Superintendent,

MALACCA.—Assistant Superintendent, Robert Derry.

MORVI.—Superintendent, Joseph Beck.

MUNGPOO.—Superintendent, Government Cinchona Plantations, Dr. George King, C.I.E., LL.D., F.R.S., F.L.S.; Resident Manager, J. A. Gammie.

OODEYPORE.—Superintendent, T. H. Storey.

POONA.—Principal College of Science, in charge of Botanical Survey, Dr. T. Cooke; Lecturer on Botany, College of Science, G. Marshall Woodrow.—Bombay, Municipal Garden: Superintendent,

RANGOON.—Agri-Horticultural Society.

SAHARUNPUR.—Botanical Department Northern India: Director, J. F. Duthie, F.L.S.; Superintendent of Garden, William Gollan.

SIMLA.—Superintendent, A. Parsons.

STRAITS SETTLEMENTS.—Garden and Forest Department. Singapore: Director, H. N. Ridley, M.A., F.L.S.; Head Gardener, Walter Fox.

PENANG.—Assistant Superintendent, Charles Curtis.

PERAK MUSEUM.—Mr. Wray.

TRAVANCORE.—Superintendent, Fred. Jas. Ingleby.

WEST INDIES.

ANTIGUA.—Botanical Station: Curator, Arthur J. Tillson.

BARBADOS.—Dod's Reformatory, Botanical Station: Superintendent, John R. Bovell.

DOMINICA.—Botanical Station: Curator, Joseph Jones.

GRENADA.—Botanical Garden: Curator, George W. Smith.

JAMAICA.—Department of Public Gardens and Plantations: Director, William Fawcett, B.Sc., F.L.S.—Hope Gardens: Superintendent, Wm. Cradwick.—Castleton Garden: Superintendent, Eugène Campbell.—Cinchona (Hill) Garden: Superintendent, William Harris.—Kingston Parade Garden: Superintendent, Jos. Harris.—King's House Garden Superintendent, Wm. J. Thompson.—Bath: Overseer, W. Groves.

BELGIAN NOTES.

THE GHENT QUINQUENNIAL.—The construction of the fine annexe, which is to occupy an area of more than 2500 mètres superficial, is proceeding rapidly. Complete success for this International Exhibition is now assured, especially as regards the Orchid departments. The grand jury has just been chosen; more than a hundred invitations having already been issued.

Universal Exhibition at Antwerp in 1894.—During the year 1894 a universal exhibition will be organised at Antwerp under Government auspices. We are now able to announce that floral exhibits have been arranged for, as well as fruit and vegetables for competition. Therefore, as on the occasion of the 1885 exhibition, it is proposed to convoke the botanical and horticultural world to an international Congress.

National Chrysanthemum Society of Brussels.—This Society, the founding of which we previously announced, held on January 15 its first general meeting, when an address, having reference to the history and decorative-value of Chrysanthemums, was delivered. Each month a Conference will be held to consider the methods of cultivation, diseases, &c., of these plants, now so popular in Belgium.

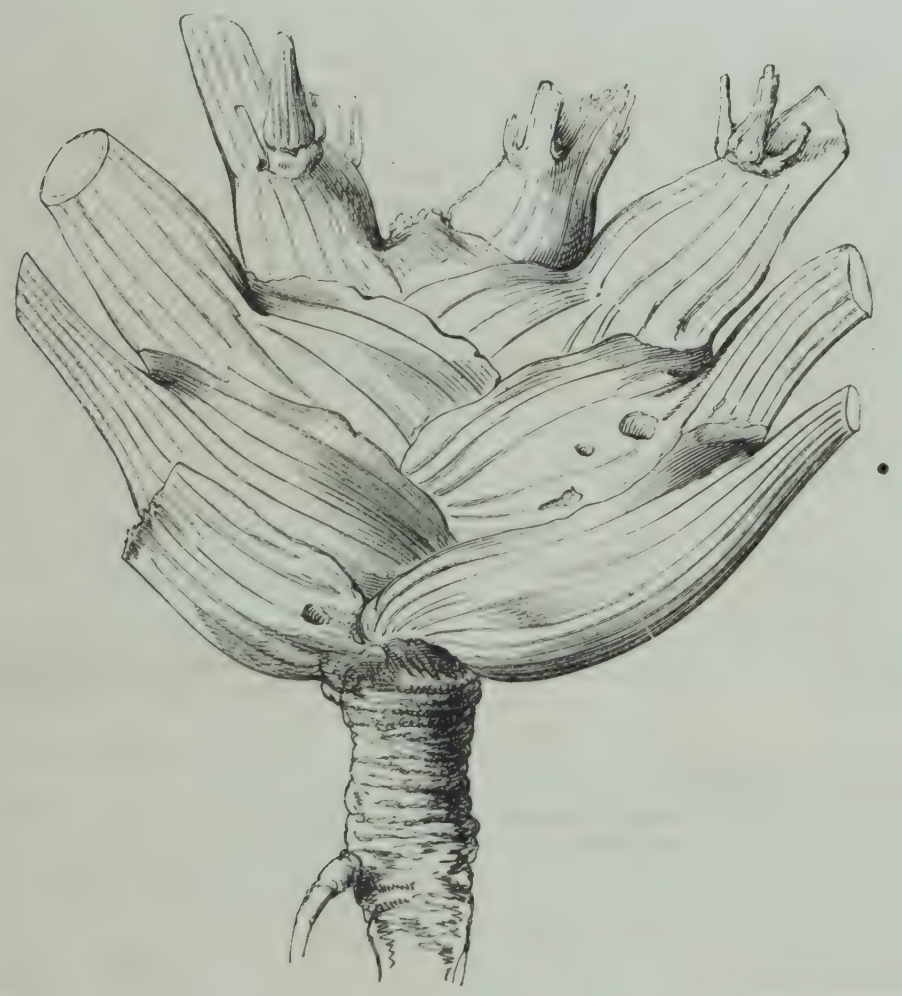

Fig. 19.—Finochio: tuberous fennel. (see p. 114.)

NURSERY NOTES.

MESSRS. HUGH, LOW & CO.

In our last issue we published some notes on plants in flower at the Clapton establishment of this firm, and now give some additional notes concerning

The Enfield Branch.—This being situated further from the smoke of the metropolis, it is here that Messrs. Low are most successful with their hard-wooded greenhouse plants. Although Azaleas, Ericas, Epacris, Pimeleas, and allied species, are propagated at Clapton, and can be grown on at the same place, it is found to be impossible to bloom them there. This does not refer so much to the Azaleas as to the others, consequently, the plants we found at Enfield are larger than those at Clapton, and nearer their blooming period. Whole houses are devoted to old acquaintances which outside a nursery one seldom meets in these days, and never in the fine specimen form that used to characterise the floral exhibitions. Ericas and Epacris in all the known varieties abound, and are in 5 and 6-inch pots, almost ready for blooming. Acacias, such as Drummondi, cordata, lineata, lophantha, longifolia, magnifica, dealbata, and affinis occupy a large space, especially A. Drummondi, which is quite a favourite. A fine lot of Chorozema Lowii, a very pretty flower indeed, are just commencing to bloom; as is Leucopogon Cunninghamii, with its graceful feathery appearance. The sweet Boronia megastigma has the attention its merits well deserve, and B. elatior is present in good quantity likewise.

Grevilleas, Tremandras, Darwinias, Pimeleas, Eriostemons, Coreas, Genista (in immense numbers), Diosmas, Daphnes, Coronillas, Tecomas, Rhododendrons, Aphelexis, and many other of our hard-wooded friends of other years attract the visitors' attention. Palms which were almost becoming monotonous are continued here at Enfield, and very fine specimens they are. Messrs. Low & Co. are also making a speciality of Cyclamens, and some very fine flowered corms have rewarded them this season. There are in all about 15,000 plants. Of the outdoor department no note is required at this season, but there are something like 60 acres at Enfield, and these are well stocked with fruit trees, Roses, and general outdoor stock.

Mr. W. Bull's, Chelsea.

Looking in at this establishment, some few days since, Mr. Bull observed that it was a pleasure to show the Orchids during this month to one who understands something about them; but to exhibit them before any who may not care to look at an Orchid except when it is covered with blossoms, was an unenviable *rôle*, rarely ending in pleasure to either party. We can easily understand this; and yet how interesting it is to watch a plant—especially an Orchid—during all its various stages of growth and development. Any cultivator knows as well as the botanist that the flowers, which contribute to our pleasure, are as surely the effect of the plant having obtained what was necessary to its well-being during growth, as the presence of these plants themselves in such quantity in a London nursery is the direct effect of the capacity they possess to brighten and beautify the things around us. Although, perhaps, every admirer of a Cattleya, Dendrobium, or Odontoglossum does not fully realise the importance of free, clean, and healthy growth followed by well-ripened bulbs and thoroughly-matured leaves; yet it would be difficult to exaggerate the importance of these things, and it is due to this very fact, that a walk amongst such plants, even in the absence of any bloom whatever, is always of interest—yea, and of instruction also—to the more thoughtful of plant-lovers; whilst to a gardener, it can only fail to be the means of instruction in proportion to the visitor's lack of observation and reflection. We were not disappointed, therefore, that at this time but little blossom was to be seen, for it afforded opportunity to see and to study the plants from another standpoint, and to note in what measure the various characteristics of the different species were developed, and to what extent they had been able to resist the subtle attacks of our London fogs. The first house we entered, contained a large number of Cypripediums, including groups of C. Lawrencianum, C. Harrisianum, C. candidulum, C. Leeanum, C. Warneri, &c. The promise of future blooms could easily be seen in the remarkably free growth the majority of the plants had made. They were likewise scrupulously clean, and abundant in foliage.

Others belonging to this very varying genus we saw in other houses, and in bloom were C. candidulum, C. Leeanum, C. vexillarium superbum, and C. Fitchianum. A few seedlings we noticed in one of the houses, which will no doubt some day swell the already bewildering number of hybrids. Cymbidium Lowianum would have disclosed her beauties some little time since had the fog been less intolerant, for the first buds had fallen an easy prey to the pest; but there are plenty of spikes that have so far escaped, and it is seldom we have seen such healthy examples of C. Lowianum and C. eburneum as are in the house which Mr. Bull devotes to their culture. This latter species is throwing capital spikes, and in some cases as many as three spikes from one growth. Cœlogyne cristata, C. c. alba, C. Lemoniana, &c., are already in sheath, one timid little bloom alone in evidence promising more to follow. Cattleyas do very well here; the best lot we saw were in a span-roofed house, and included fine batches of C. Mendelii and C. Mossiæ, which would hold their own amongst many.

The Lælias, too, are in wonderfully fine condition, especially L. purpurata, which most people will remember as having been done well by Mr. Bull for some years. The plants are large, and full of foliage, each leaf being dark green in colour, and of thick texture. A few flowers of L. anceps and L. a. stella (one of the white varieties) relieved the foliage in this house. As to the other species, many of them have thrown very strong sheaths.

In mentioning the Odontoglossums, it would be impossible to give other than the first place to O. vexillarium, that beautiful and delicate species which in so many place defy the efforts made to induce it to flourish, yet here it gives no trouble whatever, and a large stock is in the most robust health. Mr. Bull, junr., said, in reply to a query, "Oh, it gives us but little trouble, cleanliness is the secret." But there are other secrets than this one connected with the plant when its cultivation is attempted in some places. A point undoubtedly as important as any, is the temperature and general atmospheric conditions they are the subjects of. A good number of the other species of Odontoglossums were in bloom including some examples of crispum, cirrosum, maculatum, pulchellum majus, Rossii majus, Insleayii, and several others. Lycaste Skinneri and L. S. alba were likewise blooming, and the bright Ada aurantiaca, as well as the still brighter Sophronitis grandiflora, was helping to atone for the absence of others. We must not enumerate many other of the plants we saw at Mr. Bull's, but reserve any further notes until the plants are once more gay with the blossoms that we see already in embryo. The Dendrobes were looking fairly well, and the Oncidiums, together with Phaius Wallichii and P. grandifolius,

are satisfactory. Masdevallias are present in fair quantity and variety. We could not help noticing the curious and somewhat pretty bloom of Galeandra Descagnolleana; the petals and sepals are of a curious shade of brown, the lip white, with suffusion of yellow, whilst the inner part of the lip is marked with dark purple. Not often seen, probably because it is not so much a garden plant as some others of this showy order.

LEAF MOULD.

A VERY useful little pamphlet has recently issued from the pen of M. Georges Traffaut,* on the chemical and physical properties of leaf-mould in the cultivation of Vriesia splendens, Anthurium Scherzerianum, and Latania borbonica. The author, while calling attention to the increasing importance of artificial manures in horticultural practice, deplores the neglect too frequently shown by the gardener to avail himself fully of the investigations brought to light by the agricultural chemist during recent years. The experiments of the last twenty years in this department show conclusively how necessary it is that the manure employed should be suitable both to the soil used, and to the requirements of the plants we cultivate. Of all the various soils employed for horticultural and greenhouse purposes, the author considers the soil derived from decomposing leaves, humus, or leaf-mould the most effective.

There are two kinds of leaf-mould in use among the French gardeners, called *La terre de bruyère* and *Le terreau de feuilles*. It is known that these two kinds of mould are formed from decomposing plant-leaves and roots mixed with ordinary soil or sand and ferric oxide (irony matter), and that these moulds have a peculiar acid property from the humic acid which they contain.

The first description of leaf-mould, *La terre de bruyère* (peat), is formed on sandy heaths by the decay of the leaves and roots of Erica tetralix, E. scoparia, E. vagans, and frequently also from E. cinerea, which flourish there, the soil being held together in such a manner by the roots of the growing plants as to allow of its being cut into square blocks, and so dispatched for market. To prepare the material for use, it must be broken up and sifted, removing the larger undecomposed roots which hold the mass together.

The second description of soil, *Le terreau de feuilles* (leaf-soil), is different from the former, being obtained from the forests, and is the result of the decomposition of the fallen leaves mixed with the earth upon which they rest; that obtained from under the Oak trees is considered the best. These soils are light in character, and peculiarly suited for the growth of most greenhouse plants. The peculiar properties of the leaf-mould is, that it facilitates drainage and aëration, causing a quick and active plant-growth, with a free development of root. The partial decomposing leaves and roots forming the mould require a free passage of air, to allow of the nitrification of the organic matter, and given this, the roots of the growing plants develop rapidly. As both the drainage and evaporation are great, frequent waterings become necessary. The mould has also a large absorbtive power: one hundred parts, by weight, of the mould will take up one hundred and ninety parts, by weight, of water.

As it is known that the fertility of all soil is nearly connected with its powers of retaining plant-food, several experiments have been tried of the retentive properties of leaf-mould for different manurial substances, which have shown that it has a great absorbent power for potash and phosphoric acid, but that nitrate of soda is retained in a much less powerful manner. These facts agree with what has been found in ordinary agriculture.

The following table shows the amount of selected chemical constituents in 100 parts of the finely sifted leaf-mould obtained from the neighbourhood of Rambouillet (Seine-et-Oise).

Selected Constituents in Parts per hundred.

Nitrogen	0·587
Phosphoric acid	0·116
Lime	0·260
Silica (sand)	83·600
Humus (organic matter)	9·530

It is known that soils containing humus will absorb ammonia from the atmosphere, and thus increase their store of nitrogen. The organic remains of former crops or plants are also oxydised, the nitrogen being converted into nitric-acid. The fragments of silica or limestone will at the same time be more or less disintegrated by the combined action of water and air, assisted by the carbonic acid and humic acids arising from the oxidation of vegetable matter, and a portion of the insoluble plant-food be thus brought into a state suited for assimilation by the roots of growing plants.

From several carefully-conducted experiments, it has been found that the leaf-mould on being passed through a sieve, yielded 80 parts per 100 of fine soil, and that the weight of fine dry earth in one hectolitre, which is equal to about 3½ cubic feet, or 2¾ bushels, was 143 lb. The sifted-out portion was composed mainly of leaves in an early stage of decomposition, which would act on the soil to which it was added by virtue of its physical properties.

The following table shows the weight of each fertilising element in one hectolitre of leaf-mould, and its degree of assimilability.

Elements in one Hectolitre of Sifted Leaf-mould.

Total nitrogen	0·59 lb.
Lime	0·34 ,,
Phosphoric acid	0·15 ,,
Potash	0·46 ,,
Silica sand	108·68 ,,
Humus	12·39 ,,

Assimilable Elements:—

Nitric nitrogen provided in 6 months by nitrification	34·45 grammes
Phosphoric acid (soluble)	2 60 ,,
Potash (soluble)	47·45 ,,

Knowing, therefore, what are the substances directly assimilable by plants in one hectolitre of leaf-mould; it is important to enquire the best means of applying to the soil the elements that are wanting, or are not present in sufficient quantity.

Nitrogen.—Although the nitrification in the leaf-mould may be sufficiently active for us to be able to dispense with nitrogenous manures in most cases, yet there are certain species of plants which rapidly develop a large mass of foliage, and these cause a rapid and extensive draught on the nitrogen. For such, it will always be advisable to use nitrate of soda in solution when watering, and to supply it frequently and in small quantities. The presence of crystalline nitrate of soda in direct contact with plant-roots is sometimes hurtful, and the plants do not get the full benefit of the supply.

Nitrate of soda should be given in doses of 1 gramme per litre of water, that is about a quarter ounce for two gallons.

To calculate the quantity to be applied, we rely on the fact that nitrate of soda of commerce contains 15 per cent. of nitrogen. For cultivation removing 30 grammes of nitrogen, there must be applied 200 grammes of nitrate soda. The mould containing so much humus, absorbs and strongly retains ammonia.

It might, therefore, be thought advisable to use ammonium sulphate as a nitrogenous manure. But for this to be fixed the soil must contain a certain proportion of lime. This will take the acid from the sulphate and be changed into ammonia carbonate. For this salt to get assimilated by plants, it must be changed into nitric nitrogen by nitrification.

Phosphatic Manures.—Assimilable phosphoric acid is in very small quantity in leaf-mould; it is therefore necessary to add it in manure. The best form is that of pulverised bone-phosphate. Phosphate of potash is also excellent. Superphosphates yield a certain proportion of phosphoric acid soluble in water, but in leaf-mould culture they are not to be recommended, being almost always acid, and this introduction of sulphuric acid into soils poor in lime would be certainly hurtful.

We recommend precipitated bone phosphates which may contain as much as 45° per cent. of soluble phosphoric acid. Basic slag is also strongly recommended. This product, having no acidity is very good for soils poor in lime; it must be used finely ground, and mixed with the earth. The quantity of the phosphates to be applied will vary according to their percentage of phosphoric acid.

If we have need of more rapid assimilation, phosphates of soda and potash are to be recommended. The former contains one-half its weight of directly assimilable phosphoric acid. It may be dissolved in water, and use for watering the soil we wish to enrich.

Phosphate of ammonia is sometimes recommended. This gives excellent results; it furnishes both phosphoric acid and nitrogen, but it is too costly for general purposes.

To sum up, we shall apply bone phosphates or precipitated phosphates according to the duration of the cultivation.

For plants of rapid growth, phosphate of potash, soda, or ammonia.

Potash Manures.—Leaf-mould contains a considerable proportion of potash, which is only slowly available for vegetation. For certain cultivations, especially that of Ferns, potash manures have a very beneficial effect. The most rational method is to use carbonate of potash, and to apply it dissolved in water on to the soil to be manured; this salt is retained by the soil, and the plants are able to absorb it as they need. The proportions to be used vary according to the requirements of the plants cultivated. Commercial carbonate of potash contains from 52 to 63 per cent. of potash.

Nitrate of potash will serve both as a nitrogenous and a potash manure. It is directly assimilable by plants; it is very soluble in water, and must be used for watering in the same proportions as nitrate of soda. It is an excellent manure, containing 45 per cent. of potash and 13 per cent. of nitrogen. It is thus valuable when we wish to associate nitrogen and potash together.

A salt likely to become of great importance to horticulture is sulpho-carbonate of potash, which acts as a manure and as an insecticide. *J. J. Willis, Harpenden.*

(To be continued.)

* *Extrait des Documents présentés au Congrès Horticole de* 1892.

HOME CORRESPONDENCE.

THE SELFISH BOTANIST.—My attention has been called to a paragraph in your last issue copied from the *Daily Chronicle*, in reference to the deplorable plant destruction which has occasionally been perpetrated of late years, but the Irish instance selected is scarcely supported by the facts. In the first place, the three Field Club members who collected plants on the occasion referred to, were botanists, who were quite as much alive to the importance of the preservation of rare species as the writer of the paragraph in question. Secondly, only a very limited portion of the huge basaltic cliff-wall of Binevenagh mountain is accessible to even the most superb climber, and there is no danger of the extermination of its alpine varieties by the most rapacious of collecting-fiends. Thirdly, the plants actually collected on the occasion, all grow in abundance on Binevenagh with the exception of two, and of each of them one specimen only was brought away—a better record than most botanists could show who have penetrated the haunts of rare and local species. I may add that the extermination of Saxifraga oppositifolia referred to is a myth; the plant grows there still, just as it is did when first discovered. *R. Lloyd Præger, Sec., Belfast Nat. Field Club and Editor Irish Naturalist.*

ROYAL HORTICULTURAL SOCIETY'S EXAMINATIONS.—I am glad to see that the Royal Horti-

cultural Society intends holding an examination in May next, which, if it be well taken up by gardeners and horticulturists generally, cannot fail to be productive of good. Many of us have wished that something of the kind should be done either by the Royal Horticultural Society, or some other responsible body, and now the opportunity is afforded, it should not be lost, as a stimulus of this kind was very much wanted, many deserving young men having been kept in the background through want of influence, or opportunity to acquire knowledge. I wonder what the result will be? Will sufficient energy be shown to satisfy the promoters of the scheme, and induce them to continue and extend it? It will be an everlasting disgrace if, after talking so much, gardeners should let it end in talk. Of course, the thing is yet new, and the Royal Horticultural Society will have difficulties to encounter, for the examination embraces a very wide field—County Councils, technical institutes, schools, gardeners' mutual improvement societies, and other bodies. It appears to me almost impossible to frame a syllabus which should generally meet the instructions or lectures of all these different institutions. The County Councils, for instance, are working in a variety of ways. In some counties a series of lectures is given in one town only. In this county there is one lecturer, and as he has to lecture in twenty-four different parts of the county, it is impossible for students to attend them all. The subject chosen generally is fruit culture. When I first saw the announcement in the *Gardeners' Chronicle*, I wrote at once to the Secretary of the Royal Horticultural Society for particulars, and received the syllabus, &c., by return of post. I took it at once to the Inspector of Technical Education of the County Council of my county, and was courteously received by him, but the interview was not very encouraging. He said to this effect, that the syllabus was much too wide and hardly in accordance with the objects of the Council, and the books advised too expensive and too elaborate for the students, but he would think about it. The syllabus seems to me a very suitable one for gardeners, and I hope it will be adhered to. The scholarships offered will probably disappoint not a few of the aspirants, being limited to age. [Quite necessary. Ed.] I can instance three young men instructed by me, and working in these gardens, none of whom is eligible, and yet this notwithstanding they intend to sit for examination. Up to the present they have not done amiss, as they hold nine certificates, seven from South Kensington, and two from Oxford in connection with last winter's lectures; and the one who holds the most is just seventeen years of age; altogether eleven Science Certificates have been gained by young men in these gardens during the last three years. *Alfred Gaut, Berwick House Gardens, Shrewsbury.*

MUSCAT CHAMPION.—I can corroborate all that Mr. Temple says about the Muscat Champion. When planting the new vineries at Sandringham in 1864, I had most of the Vines from my friend the late Mr. James Veitch, one of them under a number—the future Muscat Champion, not then sent out. As it was a small plant, I inarched it upon a Muscadine. It made a fine rod, 12 feet in length, and fruited the third year. I exhibited bunches of it in London, and Mr. Veitch gave me great credit for growing it so well. He told me that Mr. Melville, of Dalmeny, knew how to hybridise a Grape, a very difficult thing to do, but could not grow a Grape, and also said that it had never been exhibited before—properly grown. When in Edinburgh, as a judge at the First Great International Show, I went down to Dalmeny to see the seedling Vine. I know of no Grape, except the Muscat Champion, which is a true cross between the Hambro and the Canon Hall Muscat. I have always found that it keeps better and longer than the Hambro, and with me the berries did not decay when matured. The grower who is responsible for that statement probably grew it on its own roots. When living at Bignor Park, Sussex, I sowed two seeds of it which I had in my pocket for two years, to see which of the parents it would revert to. Only one plant came up, and the following spring it was inarched on the Black Hamburgh; it made a fine thick rod, and produced fruit the following year, and to my surprise it came true to the parent, but it was a shade darker in colour. I exhibited it at South Kensington, but the committee did not consider it different from the parent. Probably very few of the committee had a distinct recollection of the colour of the Muscat Champion. Mr. Blackmore once said to me, in reference to Souvenir du Congrès Pear, that it was a Pear for the public. Well, Muscat Champion is just the opposite; it is a Grape for the epicure and the gentleman's dinner table. *William Carmichael, 14, Pitt Street, Edinburgh.*

VINE DRESSING.—Seeing, in your last issue, articles on "Petroleum Oil as an Insecticide," by persons whose Vines had suffered from its use, I was struck with the importance which attaches to the use of insecticides, and with the uncertain knowledge which prevails as to their proper use. It seems a pity that so many failures should be experienced when a cheap and trustworthy insecticide exists in "Bentleys," which I have used for the past three years with great success in destroying insect-pests and cleansing the Vines. For a winter dressing, I use half a pint of Bentley's Insecticide to 1 gallon of water. I am surprised that the old remedy of petroleum, clay, soft-soap, &c., should still be in use, notwithstanding the serious results that have followed its use; and, indeed, when great care is not exercised, mishaps are unavoidable. It is well known that when the forcing of the Vines is begun, the clay mixture gets washed off by the daily syringings, and this generally gives the newly-cleaned vineries a dirty appearance. With Bentley's Insecticide, however, this is not the case. It is productive of better results, and does away with the labour attending the making and use of the other mixture, as it mixes readily with water. *G. Winter, Walk House Gardens, Barrow-on-Humber, Hull.*

VINE-DRESSING AND THE USE OF PETROLEUM.—I quite agree with what Mr. Gooden says in the *Gardeners' Chronicle*, p. 78, and believe that the use of petroleum as a dressing for Vines is very dangerous, and cannot be too strongly condemned. When living in the vicinity of Tunbridge Wells, I remember paying a visit to a neighbouring garden, and seeing some early Vines which had been dressed with petroleum, and they were grievous to behold. I do not think they could ever recover. The gardener who was there at that time might enlighten your readers as to their fate. I have always found the following to be a satisfactory dressing for the Grape Vine:—Take ½ pint of gas-tar, 1 pint of soft-soap, 5 pints of clay; mix well together in a pan. Then put the whole into a sauce-pan, and let it simmer over a fire for about forty minutes. *Thos. Harris, Ashby St. Leger, Rugby.*

WELLINGTONIA.—The height of a specimen of Sequoia gigantea at Shanbally Castle, Ireland, is given as 70 feet in the *Conifer Report*, p. 561, whilst at p. 571 it is cited as 80 feet. Which is the correct measurement? I estimate a specimen in my garden at 78 feet. *Bitton.* [It is unfortunate that the dimensions of the English specimens were not more fully recorded in the *Conifer Report*. What, for instance, is the present height of the specimen at Lamorby Park, Bexley, which in 1873 measured 37 feet? or that of the one in the Ottershaw Nursery, recorded as having attained the height of 38 feet in the same year? Ed.]

HARDINESS OF CAMELLIAS.—Last summer I turned three Camellia plants out of a house, as they had got too large for it. They were stood in the south-west corner of an Arbor-vitæ hedge, and have remained there during the past severe weather, without seeming to be the least affected by the frost. Two of the plants were C. alba plena, and one C. rubra. It has not surprised me much that these plants should have withstood the frost so well, because, in another we had a grand specimen of the semi-double scarlet variety that had been growing in the open for over twenty years. It is now about 12 feet high, and 8 feet through; and each year it flowers grandly, and usually during the month of April, and this season it is looking as well as ever. By its side I planted four of the greenhouse varieties, and although they did not make quite such strong growth as the hardier kind, they made considerable progress, and were far from a failure. I consider that the best house to grow Camellias in is one where they can receive quite cool treatment, with the exception of one pipe in the house, so as to be able to keep out frost during the early spring months, and when they are flowering in such structures. *A. P.* [We may remark that our correspondent resides in a maritime county in the south. Ed.]

CAUSE OF GOOD FLAVOUR IN GROS COLMAR.—On p. 79 of the *Gardeners' Chronicle*, I stated that absence of insect pests and plenty of ammonia were the causes of the good flavour of the Dryden Bank Gros Colmar Grapes, but I fear this is only a fraction of the truth about the matter. Mr. Thomson, of Clovenfords, who also grows this Grape to perfection as regards flavour, thinks, so I am informed, that a Muscat temperature is the chief factor; while Mr. Castle, who managed a Grape-growing establishment near King's Lynn, and is now occupied in the same kind of work at Fordingbridge, used to inarch his Gros Colmar Vines on the Muscat of Alexandria, to improve the flavour. I only make these few suggestions to induce practical men to give their opinions in your columns. *Vagabond.*

PERSIMMONS.—Referring to the article on the Kaki in the *Gardeners' Chronicle*, p. 50, I may say that I saw a fine basketful of ripe fruit of this tree at Mr. Pullen's, fruiterer, Exchange Street, Manchester, at the beginning of this month. They were of the most brilliant Tomato-like scarlet. The week following I asked what sale there had been for them, and was told that last year they sold well, but this season there was no sale for them, and they had all gone bad. I brought two away with me, perfectly soft, and of a more yellow shade than previously. I found the mucilaginous pulp by no means bad; neither of the fruits contained seeds. *R. Milne-Redhead.*

THE LATE J. SHEPPARD.—For ever have disappeared from the pages of the *Gardeners' Chronicle*, the familiar initials of J. S. To thousands of readers it is just possible that such was the extent of their knowledge of him. On the other hand, there were hundreds, especially of his own vocation who knew him in the flesh, and were as familiar with his speech and embodiment as with his writings. The great feature of the deceased as a gardening contributor, was his steady practical nature. He never indulged in flights of fancy, but always kept strictly to the subject, and from a gardener's point of view he might be said to belong to the old school of gardeners; although in the gardening school there is no break or intermission, or perhaps change, only development. The principles expounded by Mr. Sheppard will always remain; the methods by which they are utilised may, and indeed do, vary. The great difference between a veteran gardener, who, perhaps started in life comparatively uneducated, and an academical young gardener of to-day is, that whilst the former had to find his knowledge through many years of hard practical experience under great difficulties, the youth to-day starts, that is, if he has properly utilised his youth, with full theoretical knowledge. Still he will only make a good gardener when he applies all this theory to sound practice. This is the chief distinction between the earlier school of gardeners, as found in the late Mr. Sheppard, and in that of a few of his aged contemporaries, still living, and the gardener of the future, who has yet to win distinction by hard practice. *A. D.*

THE FROST AND BROCCOLI.—Already the severity of the frost is seen by the destruction of many Broccoli (as well as other winter crops). I never was much in favour of heeling over Broccoli in October or November, but now I notice a row of Methven's Latest, which were lifted and placed beside another row of this excellent late variety, has stood through the severe test almost uninjured. The same cannot be said of its fellows (same variety), which have suffered somewhat, though less than most other varieties. When lifting, the balls of soil (on the roots) were carefully preserved, and the stems were well covered up with soil. The plants were placed slightly on their sides, which seems to have (to some extent) warded off the severe frost from the hearts of the plants, which are perfectly sound. *M. T., Stirlingshire, N.B.*

REMEDY AGAINST RED-SPIDER AND MILDEW ON VINES, ETC.—I read with interest the article of your correspondent, Mr. Williamson, in the *Gardeners' Chronicle*, p. 50, of the issue of January 14, and thinking it may be of value to your readers who are troubled with red-spider and mildew on the Vine leaves and fruit, I wish to say that the following is a sure and safe remedy to use. Into three pints of soft water put one pound of flowers-of-sulphur, and place on a gentle fire; when boiling, add a lump of fresh lime (the fresher the better) about the size of a hen's egg. In about three minutes after the lime has been added, the sulphur will turn a dirty-brown colour, and sink to the bottom; then add a small piece of alum to refine it. Keep boiling for fifteen minutes, then let get cold,

carefully remove the scum which will be found formed on the surface, strain off, and bottle for use; when wanted for use, add a small 60-pot full, to 4 gallons of rain-water at a temperature of 75°. The best time to syringe the Vines with this mixture is at closing time, taking care to well damp the surface, as well as walls of the house and the underside of the leaves; if carefully applied it may be used up to the time the Grapes are well advanced. Care must be taken in the making not to put too much lime, or it will spot the foliage and berries; the above I have never known to fail to eradicate red-spider and mildew. It will also be found a good remedy for mildew on Roses and Chrysanthemums, and will not leave the foliage white as when lime and sulphur are used in equal proportions. *W. G. B.* [The above is an old well-known remedy, but it will spot the berries, preventing their further development unless the bunches are syringed abundantly with clean soft water within ten minutes after applying it. With this exception, our correspondent is right in calling it a good remedy. ED.]

A GOOD SUMMER LETTUCE, NEW YORK.—Two years ago, two small packets of seeds of American Lettuce were given me, with the request that I would make a trial of them. Both belonged to the Cabbage section of Lettuce, were of large growth, and said to be great favourites with the New Yorkers. The name of one was Big Boston, and the other, New York. Both were sown with other sorts towards the end of the month of April, rather thinly, in rows about 15 inches apart, and when large enough, they were thinned to 1 foot apart, to stand for hearting. They did not come into use so soon as All the Year Round and a variety called Continuity, but the American sorts were both very much larger. The variety Big Boston I did not like so well as All the Year Round, and should not grow it again, as it was not so firm-hearted; but the kind called New York was good hearting and crisp eating, therefore a desirable Lettuce. But apart from these points, its chief recommendation was its lasting in use so long, that, is, not bolting or running to seed, as do so many at the end of July and in August. I sowed a small quantity of seed of it in July, to test it as a November Lettuce, but found it would not withstand 10° of frost. It is, however, as good a summer Lettuce as can well be grown. *A. H.*

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Having been elected a member of the committee of the above Institution at the recent general meeting, I hope I may be excused for approaching my fellow-gardeners (in the interest of the Institution), in the hope that I may be the means of influencing their minds in favour of a more general and generous support of its funds. It cannot be said that I am asking others to do what I have not attempted to do myself, as I have contributed, in one way or another, between £70 and £80 to its funds. It is difficult to understand why every gardener does not rally round this splendid property of £29,000, especially when it is said that every shilling of it is their own. One would think that even from motives of selfishness, if from no higher consideration, every gardener would rally round it, and strive to do all in his power to promote its usefulness and prosperity. There cannot be less than 30,000 gardeners, nurserymen and others engaged in horticultural pursuits, who are interested in its welfare, and if as many of these as can afford it subscribed their guinea a year, and if the remainder who are unable to do this, were to collect small sums amongst themselves annually for the benefit of its funds, the question of old age pensions, as far as it relates to gardeners, would be solved. Objections have been advanced by many against the Institution because it is not founded on the lines and principles of a benefit society, where a member can claim help at any time in case of need. On the surface this may appear to be a reasonable objection, and I am afraid has been the cause of many not subscribing to its funds. But I think on a little consideration that this objection may be proved to be an erroneous one, and especially as in the stopped in times of ase wages are scarcely now not feel the pinch of ess, and who therefore, do mechanics and others who erty at this time like whose pay is stopped when we paid by the hour, and on this point, I may say, I hark ceases. As bearing benefit society for upwards ve been a member of a about 22*s.* a year; and if of twenty years, paying member, I shall have to go I am to remain a benefit on paying that sum as long as I live, and the benefits are—in case of sickness and permanent disability from work, I am entitled to 10*s.* a week for the first year, about 7*s.* the second year, and after that, I believe, the pay is reduced to 3*s.* per week for life. Let me ask my fellow gardeners, who are still sceptical on this point, to compare this with the advantages offered by the Gardeners' Royal Benevolent Institution, even from a benefit point of view, where after subscribing a guinea for fifteen years, or £10 10*s.* down, a member is almost certain to be placed on the Pension List if he is of good character and incapacitated from work, and in want; receiving, without any further cost or trouble to himself, £20 a year for life, whether his life be short or long. Another objection has occasionally been levelled at the Institution, viz., that some gardeners who had subscribed but little, and others who had not subscribed at all, were occasionally elected pensioners. On this point I may say that we must not lose sight of the fact that by far the largest proportion of the property of the Institution has been subscribed by people out of pure benevolence, for the relief of aged and destitute gardeners, and I, for my part, would be very sorry to see this principle of benevolence infringed upon or curtailed in any way, and I hope and believe it will not be allowed to impose a barrier to prevent subscriptions flowing in. The committee, as is well-known, have introduced a clause into their rules giving almost absolute certainty of election to those who may have subscribed for fifteen years, and the new rule passed at the general meeting a few days ago will give subscribers substantial advantages over non-subscribers, in so far that a subscriber for four years will have fifty votes credited to him, and fifty more added for every year subscribed afterwards up to fourteen years. My appeal in favour of the Institution, even from a benefit and investment point of view, will, I hope, commend itself to the judgment of your readers. But I beg very respectfully to appeal to my brother gardeners from a higher level than a benefit one. That man's life is a poor and a barren life, who lives entirely to himself, and nothing noble or good has ever been accomplished without a sacrifice of some sort. The gardeners of the past half century (and others interested in gardening and gardeners) have built up a noble standard of garden charity which is now shedding gleams of joy and brightness round the declining life of many of our fellow workers who have fallen helpless by the way. Let me, then, appeal to all gardeners, and others associated with them in the calling, to rally round this noble institution, and to strengthen it with their active support that all the deserving in our craft may claim a shelter under its wing in the time of adversity and want. *Owen Thomas, The Royal Gardens, Windsor, January* 23, 1893.

Obituary.

STUART MOUBRAY BURNETT. — Readers will regret to learn of the death of Mr. STUART M. BURNETT, late of Balbithan, Keithhall, Aberdeenshire, which took place rather unexpectedly at his residence in Old Aberdeen, on Monday morning. Mr. Burnett, who was in his 68th year, was the fourth son of the late Mr. John Burnett, of Kemnay, Aberdeenshire, and younger brother of the present proprietor. Shortly after the demise of his father, Mr. Stuart Burnett removed to Balbithan, where he lived for nearly thirty years with a sister, and, during the whole of that long period, he exclusively devoted himself to botanical and natural history studies. As a result of his enterprise and industry in this direction, deceased was able to get together a very large and fine collection of plants, beasts, birds, &c., all of which he had carefully preserved, and which formed a very interesting natural history museum. He was looked upon as an authority in such matters; and in response to many invitations from his brother enthusiasts—the members of the Aberdeen Natural History Society — he had on numerous occasions contributed valuable papers to the meetings of that body. These he had been asked to publish in book form, but never consented to do so. In addition to these papers, he had written very extensively on natural history, and it is very probable that the whole of his MSS. will be reproduced in a more permanent form than hitherto, and the public may have the benefit of his store of knowledge on these subjects. Mr. Burnett, in the pursuit of his favourite study, received, it may be explained, a severe injury to the spine by falling from a tree in the woods of Keithhall some years ago, and which for the remainder of his life prevented him from taking much outdoor exercise. Mr. Burnett's remains were interred on Friday in Old Machar Churchyard, Old Aberdeen, amid a large gathering of his relations and friends.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

"*M.*" would be glad if some of our correspondents would name the best of the Chrysanthemums for exhibition which came out in 1892 and 1893.

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E. 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending January 21, is furnished from the Meteorological Office:—

"The *weather* was cloudy or dull in almost all parts of the kingdom, with frequent but not heavy falls of rain, sleet, or snow. In the south-western and western parts of England, however, the conditions were often fine and bright.

"The *temperature* exceeded the mean in 'Scotland, E. and W.,' and in 'Ireland, N.,' and just equalled it in 'England, N.,' 'Ireland, S.,' and the 'Channel Islands;' elsewhere it continued below the mean, the deficit ranging from 1° in 'England, N.E.,' to 4° in 'England, S.,' and 5° in 'England, E.' The highest of the maxima were registered on the 18th, when the thermometer rose to 52° in 'Scotland, E. and Ireland, S.,' and to 50° or 51° in most other districts; over the 'Midland Counties' and 'Ireland, S.,' however, the highest reading was 47°, and in 'England, E.,' 44°. The lowest of the minima were recorded during the earlier part of the period, and ranged from 17° in 'England, E. and S.,' and 18° in the 'Midland Counties,' to 28° in 'England, N.W.,' and 29° in the 'Channel Islands.'

"The *rainfall* was much about the mean in

'Scotland, N. and E.,' and 'England, N.E. and E.;' in all other districts the fall was deficient, and in 'Scotland, W.,' 'England, S.W.,' and 'Ireland, S.,' the deficiency was large.

"The *bright sunshine* exceeded the mean in 'Scotland, W.' and 'England, S.W., N.W., and N.E.,' but was very little prevalent elsewhere. The percentage of the possible duration ranged from 28 in 'England, S.W.,' to 7 in 'England, S.,' and to 3 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, January 26.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

No alteration. Business very dull. *James Webber, Wholesale Apple Market.*

POTATOS.

The weather being more favourable, farmers are loading freely, and stock is increasing. Prices still continue firm. Best samples, 90*s.* to 100*s.*; ordinary kinds, 50*s.* to 55*s.* *J. B. Thomas.*

SEEDS.

LONDON: *Jan.* 25.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a fair business now doing in seeds. The United States it is now evident, have overshipped their Clover seed, and as the stocks they hold are proving unsufficient for their own requirements, American merchants are attempting to buy back from Europe their own seed. In Trefoil an active business has been passing at enhanced currencies. There is no change this week in either Alsike or White. Rye-grasses keep very firm. For Tares there is an improved inquiry. Canary seed is steady. In Hemp seed the late sudden rise of 8*s.* is maintained. For Peas and Haricots the sale is slow. Linseed is dearer, Scarlet and White Runner Beans offer at tempting rates.

FRUITS AND VEGETABLES.

SPITALFIELDS: *Jan.* 24.—Quotations:—Collards, 2*s.* to 3*s.*; Savoys, 3*s.* to 4*s.*; Cauliflowers, 7*s.* to 10*s.* per tally; Sprouts, 1*s.* 3*d.* to 1*s.* 6*d.* per half-sieve; Turnip-tops, 2*s.* to 3*s.* per sack; Curly Kale, 1*s.* to 1*s.* 6*d.* per bushel; Seakale, 1*s.* 3*d.* to 1*s.* 6*d.* per punnet; Greens, 2*s.* to 3*s.*; Turnips, 2*s.* 6*d.* to 3*s.*; Carrots, 2*s.* to 3*s.*; Parsley, 6*s.* per dozen bunches; Horseradish, 1*s.* 3*d.* to 1*s.* 6*d.*; Celery, 1*s.* 3*d.* to 1*s.* 6*d.* per bundle; forced Rhubarb, 1*s.* 3*d.* to 1*s.* 6*d.* per dozen bundles; Parsnips, 8*d.* to 1*s.* per score; Beetroot, 1*s.* to 1*s.* 6*d.* per dozen; Mustard and Cress, 2*s.* per dozen baskets; English Onions, 8*s.* to 8*s.* 6*d.* per cwt.; Spanish do., 8*s.* to 10*s.*; Bordeaux, do., 6*s.* to 6*s.* 6*d.* per case; Belgian and Dutch do., 6*s.* 8*d.* to 7*s.* 9*d.* per bag of 110 lb.; Carrots, 50*s.* to 60*s.* per ton; foreign Tomatos, 1*s.* to 1*s.* 6*d.* per box; English Apples, 3*s.* to 6*s.* per bushel; American, do., 13*s.* to 18*s.* per barrel.

BOROUGH, *Jan.* 24.—Quotations:—Cabbages, 3*s.* to 3*s.* 6*d.*; Savoys, 4*s.* to 4*s.* 6*d.* per tally; Cauliflowers, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen; Spinach, 1*s.* 6*d.* to 2*s.* per bushel; Sprouts, 1*s.* 6*d.* to 1*s.* 9*d.* per half-sieve; Carrots, 2*s.* 6*d.* to 3*s.*; Turnips, 1*s.* 6*d.*; Parsley, 4*s.* per dozen bunches; English Onions, 7*s.* to 9*s.*; Dutch do., 5*s.* to 6*s.* 6*d.* per cwt.; Horseradish, 1*s.* 6*d.* to 1*s.* 9*d.* per bundle; English Apples, 2*s.* 6*d.* to 10*s.* per bushel.

STRATFORD, *Jan.* 25.—There has been an excellent supply of all kinds of produce at this market during the past week, and a good trade was done at the prices shown below:—Savoys, 1*s.* 6*d.* to 5*s.* per tally; Greens, 9*d.* to 1*s.* 3*d.* per sieve; Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; do., 2*s.* to 2*s.* 6*d.* per bushel; Scotch Kale, 10*d.* to 1*s.* per sieve; Turnips, 40*s.* to 60*s.* per ton; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle-feeding, 24*s.* to 35*s.* per ton; Parsnips, 1*s.* to 1*s.* 6*d.* per score; Mangolds, 17*s.* to 20*s.* per ton; Swedes, 20*s.* to 22*s.* per ton; Onions, English, 160*s.* to 180*s.* per ton; do., Dutch, 5*s.* 6*d.* to 7*s.* per bag; Apples, English, 2*s.* to 2*s.* 6*d.* per bushel; do., American, 16*s.* to 24*s.* per barrel; Celery, 6*d.* to 1*s.* per roll; Horse Radish, 1*s.* 9*d.* to 2*s.* per bundle.

FARRINGDON: *Jan.* 26.—Quotations:—English Onions, 8*s.* to 9*s.* per cwt.; Parsnips, 60*s.* to 65*s.* per ton; Carrots, 50*s.* to 55*s.* per ton; Turnips, 50*s.* to 55*s.* per ton; Sprouts, 1*s.* 3*d.* per half-sieve; Savoys, 4*s.* to 5*s.* per tally; Horseradish, 2*s.* 3*d.* per bundle; American Apples, Baldwins, 14*s.* to 17*s.* 6*d.*; Greenings, do., per barrel; Tomatos, 1*s.* 9*d.* per box; Grapes, 14*s.* to 17*s.* per barrel.

POTATOS.

SPITALFIELDS: *Jan.* 24.—Quotations are unaltered from those last reported.

BOROUGH: *Jan.* 24.—Quotations:—English Magnums, 50*s.* to 65*s.*; Hebrons, 60*s.* to 70*s.*; Snowdrops, 60*s.* to 75*s.* per ton.

STRATFORD: *Jan.* 25.—Quotations:—Magnums, 50*s.* to 65*s.*; Bruce do., 55*s.* to 70*s.*; Imperators, 55*s.* to 65*s.*; Scotch Magnums, 60*s.* to 75*s.*; Scotch Bruces, 60*s.* to 85*s.*; Main Crop, 80*s.* to 100*s.*; Belgian Magnums, 50*s.* to 60*s.* per ton.

NOTICES TO CORRESPONDENTS.

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of **75 per cent.**

Advertisers are also reminded that the "Chronicle" circulates among ALL *classes of gardeners and garden-lovers at home, has a specially large foreign and colonial circulation, and is preserved for reference in all the principal Libraries.*

ADDRESSES WANTED.—Mr. A. Greaves, late of Thwaite House Gardens, Cottingham, and Mr. Cullen, late of Gresham Road, Staines, are requested to supply their present addresses. Letters forwarded to them at the above addresses respectively having been returned.—*Hortus.* J. Aikman, Whitestile Road, Brentford, Middlesex.

ANTS EATING THE STAMENS OF PEACH BLOOMS: *A. P.* Saturate wood shavings in coal tar, and strew these round the stems of the trees; but do not let the tar touch living tissues. Rags dipped in petroleum may be placed in the ants' runs, or carbolic acid strewn about.

APPLES: *E. Ockenden.* We cannot answer the questions put, neither could any dealer do so, in advance of the time. It would be mere guesswork. Some of the prices realised by Tasmanian fruit were not such as would be likely to induce larger importations than last year. If fruit arrive in first-rate condition, good prices are obtainable.

BAMBUSA FORTUNEI: *L. B. G.* Hardy in this country.

BOOKS: *W. Hilling.* Publisher of *London Market Gardens.* MacMillan & Co., Bedford Street, Covent Garden.

CARNATION: *H. & Sons.* The too common Carnation rust often figured in our columns. Burn the plants, or spray with sulphate of copper in a weak solution.

DENDROBIUM NOBILE, NOT FLOWERING: *J. S.* The plant may have refused to flower, owing to your not resting it properly, or the pseudo-bulbs not being well matured, or too weak; or the old pseudo-bulbs which contain a certain amount of nutriment were removed, which may not be done under ordinary treatment. The sketch sent resembles D. speciosum. The flower spikes (2) are emitted from the apex of the stems or pseudo-bulbs.

ELMS: *G. C.* The pink fungus, Tubercularia, occurs commonly on dead wood. We do not think the fungus kills the tree, but some other cause, and the fungus comes after. See fig. 20.

FIG. 20.—TWO FUNGI GROWING ON DEAD WOOD, THE UPPER ONE, TUBERCULARIA; THE LOWER ONE, NECTRIA.

EUCHARIS: *E.* Your bulbs are attacked by the mite. Some say destroy the bulbs; others say, grow your plants as well as you can, and take no heed of the disease.

INSECTS—GRUB IN VALLOTA: *J. S.* The grub in Vallota is no doubt that of Merodon, which is so injurious to Narcissus and other bulbs. Destroy the infected bulbs by burning them; not by simply throwing them away on the rubbish heap. *R. M. L.*

NAMES OF FRUITS: *A. P.* 1, Brabant Bellefleur; 3, Court of Wick; 4, Boston Russet; 5, Wyken Pippin.—*T. H. C.* Apples not recognized; too much rubbed and bruised.

NAMES OF PLANTS: *G. H.* 1, Libonia floribunda; 2, Eupatorium grandiflorum var. album; 3, Chimonanthus fragrans.—*W. R.* 1, Toxicophlœa spectabile (Poison bark); 2, Arbutus procera; 3, Eriobotrya japonica, Loquat; 4, next week; 5, Ruscus androgynus.—*Alpha.* 1, Pteris cretica; 2, Selaginella Wildenovi, of gardens; 3, S. Mertensii variegata; 4, Lastrea glabella; 5, Adiantum hispidulum; 6, Polypodium aureum; 7, Adiantum trapeziforme; 8, Asplenium australasicum; 9, Agapanthus umbellatus variegatus 10, Clianthus puniceus, probably, send flowers 11, Adiantum excisum multifidum; 12, Aspidium coriaceum capense; 13, Asplenium Belangeri; 14, Aspidium (Cyrtomium) falcatum; 15, Lomaria gibba platyptera; 16, Asplenium bulbiferum; 17, send fertile frond; 18, Aspidium aculeatum (Polystichum); 19, A. angulare grandiceps; 20, Phœnix sylvestris. Six specimens at one time is our limit. How do you think we could do our duty to our other subscribers, and pay our own expenses, if so much extra-editorial work was generally thrust upon us?—*Sindrey, Mon.* Stanhopea grandiflora.—*G. A., Eltham.* Odontoglossum odoratum.—*W. S., Alton.* The Nephrodium may be distinct, but the species is not in favour with market growers, at least.—*T. B., Nottingham.* Your plant is a Gingerwort, but which, it is impossible to say without a perfect specimen. With regard to the Cinerarias, anything which causes a check would produce the result shown in your specimen. *A. G.* 1, Phyllirea angustifolia; 2, Photinia serrulata; 3, Pernettya mucronata; 4, Streptosolen Jamesoni; 5, Cyrtodeira chaotalense; 6, flowers wanting. Send again.

NEW VARIETIES OF CHRYSANTHEMUMS: *X. Y. Z.* Japanese: William Seward, Beauty of Exmouth, J. Shrimpton (Japanese reflexed), J. W. Childs, Mrs. Bruce Findlay, Lizzie Seward, Miss Dorothy Shea, Charles Blick, W. H. Atkinson, Mrs. A. J. Hubbuck, Autumn Tints, Countess of Hambledon, Mrs. W. Herbert Fowler. Incurved and Japanese incurved: Lord Brooke, Miss Annie Manda, M. Alphonse Seux, M. de Longhii, M. H. Briscoe Ironside, Mrs. Sharman, Secretary Farson, W. A. Manda, Yonitza. Anemones, Delaware, and Gertrude Bornemann.

NURSERY TRADE IN AUSTRALIA: *J. C.* The Emigrants Information Office would doubtless furnish trustworthy information on application being made. The address is 31, Broadway, Westminster, S.W.

PETROLEUM AND VINES: *C. W.* The mixture of soft soap, clay, cow-dung, and fir-tree oil, was sufficiently effective and nasty enough to disgust the most hardened insect, without the addition of petroleum. We do not suppose the latter will do any harm to the Vines at the rate of half-a-pint to the bucketful of the mixture, because it has become so attenuated and divided amongst the whole mass of clay. Read *W. R.'s* note on the subject in our last issue. It contains the pith of the matter.

SEEDS OF FINOCHIO: *F. G.* Finochio is a variety of common garden Fennel (Fœniculum officinale), much grown as a vegetable at Florence. It is an annual—at least, it is treated as such; a low-growing, distinct, and thickset plant, with a very short stem, which has the joints very close together at the base (see fig. 19, p. 109). The leaves are large and finely-cut, of a light green colour, the leaf-stalks very broad at the base, of a whitish-green colour, overlapping each other, forming a kind of enlargement about the size of a hen's egg. Sow in the spring for a summer crop, and towards the end of summer for an autumn crop. It is sown in rows 16 to 20 inches apart. The seedlings should be thinned out to 6 inches apart. The plant is usually eaten boiled like celeriac and is very delicious though almost unknown here.

STOCKS FOR APPLES AND PEARS IN A LOW BOGGY SITUATION: *E. F.* Not a suitable place for fruit trees; but if it is to be drained, you should plant on mounds standing at the apex 1 foot to 1½ foot above the surrounding level, and use as stocks the Quince for the Pears, and Paradise for the Apples. The Quince stock will limit the number of varieties of Pears, as but few do well on it. A noted fruit grower gives the following as being very profitable on the Quince as bushes and small trees:—Doyenné d'Eté, Marie Louise d'Uccle, Bon Chrétien (Williams), Souvenir du Congrès, Beurré d'Amanlis, Fertility, Emile d'Heyst, Louise Bonne of Jersey, and Beacon. The following are late varieties:—Doyenné d'Alençon (but it should be in a warm position), Winter Nelis, Josephine de Malines, Beurré Sterckman, Bergamotte D'Esperen, excellent as a bush, and all do well on Quince.

THE ROYAL HORTICULTURAL SOCIETY'S EXAMINATIONS: *W. W.* It would obviously be impossible to print the questions that will be put. We have sent your communication to the Secretary of the Royal Horticultural Society.

THORNS LEAFING IN THE WINTER: *Hortus and G. H. S.* Any plant putting forth leaves at midwinter or about Christmastide was considered in olden times to possess miraculous virtues, as well it might be.

THRESHING PEAS WITH FLAIL OR MACHINE: *Sydney Anderson, Hawkes Bay, N.Z.* Provided the seed is well ripened, it is immaterial which method be adopted.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

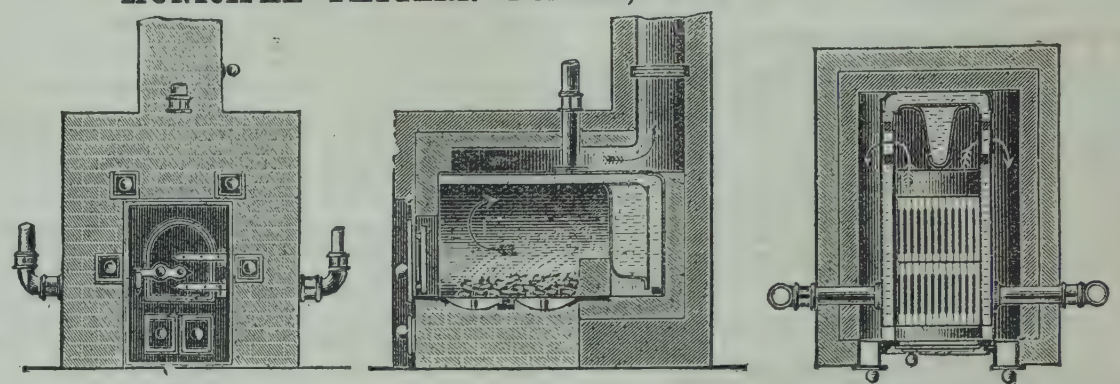
And others with SHELVES, and HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.



—FRONT ELEVATION— —LONGITUDINAL SECTION— —SECTIONAL PLAN—

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box water space and V-shaped back. The front elevation shows it set in *brickwork, which is necessary for this class of boiler.*

TESTIMONIALS.

Re HEATING APPARATUS. Borough Engineer's Office, Municipal Buildings, Leeds. *January* 9, 1886.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings.

The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, *November* 10*th*, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESSRS. THOS. GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) G. W. BASHFORD.

And HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1*s.* 6*d.*; 8-in., 2*s.*; 10-in., 3*s.*; 12-in., 6*s.* 6*d.* 15-in., 8*s.*

(*The larger sizes are very strong for carriage drives.*)

HOLLOWAY'S PILLS.—Good Spirits.—Everyone has frequently experienced sudden personal changes from gaiety to gloom. The wind and weather oftentimes receive the blame when a faulty digestion is alone the cause of the depression. Holloway's Pills can be honestly recommended for regulating a disordered stomach and improving digestion. They entirely remove the sense of fulness and oppression after eating. They clear the furred tongue, and act as a wholesome stimulant to the liver, and as a gentle aperient to the bowels. They healthfully rouse both body and mind. Holloway's Pills are the best-known antidotes for want of appetite, nausea flatulency, heartburn, langour, depression, and that apathy so characteristic of chronic derangement of the digestion.

Begonias and Gladioli.—Special Notice.

MESSRS. PROTHEROE AND MORRIS beg to DRAW ATTENTION to the LARGE QUANTITIES of the above now being SOLD at THEIR ROOMS almost every day. The Bulbs are sent from some of the best Growers in the country, and comprise splendid strains.

Catalogues forwarded on application.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, February 10, at half-past 12 o'Clock, by order of Mr. F. Sander, a superb importation of

ODONTOGLOSSUM PESCATOREI,

in splendid condition, being plump and sound. There is no shadow of a doubt that forms of rare beauty and merit will appear from this importation, many of the plants offered being decidedly distinct in appearance. It is a well-known fact that, flourishing together with O. Pescatorei, are other species, such as tripudians, triumphans, &c., and to their presence we are indebted for the grand hybrid forms that have so frequently appeared.

There will also be included a fine lot of ANGULOA CLOWESII, in excellent condition; ADA AURANTIACA, sound and healthy; a fine lot of the lovely MILTONIA PHALÆNOPSIS, a distinct-looking CYMBIDIUM SPECIES, a new EPISTEPHIUM, BRASSIA SUPERBISSIMA, SOBRALIA IMPERATRIX, the snow-white Sobralia.

CYPRIPEDIUM STONEI,

in superb plants; many extra broad-leaved, distinct-looking pieces are among them.

CALANTHE OCULATA GIGANTEA.

The grandest of the genus. Enormous inflorescence, with bold and lasting blooms. Very rich in superb varieties. SUMMER-FLOWERING. A Grand Lot.

AND MANY OTHER CHOICE AND FINE THINGS.

Friday Next.

An unusually IMPORTANT SALE of HARDY PLANTS and BULBS, undoubtedly the most extensive assortment ever offered, comprising—

10,000 CARNATIONS, PICOTEES, PHLOX, DELPHINIUMS, PYRETHRUMS, PÆONIES, GAILLARDIAS, HOLLYHOCKS, MEGASEAS, SUNFLOWERS, and others.

IMPORTATIONS of PLANTS and BULBS from Texas, South Russia, America, California, Japan, and Germany.

THOUSANDS of ENGLISH-GROWN LILIES,

including beautiful Bulbs of the rare L. Wallichianum superbum, Bloomerianum magnificum, Hansoni, Humboldtii, Washingtonianum, platyphyllum, speciosum in many varieties, and others.

10,000 Berlin Crowns LILY OF THE VALLEY.

NEW CARNATIONS. NEW CALLAS.

NEW CANNAS. NEW PINKS.

A very fine lot of MONTBRETIAS, DAHLIAS, New PERENNIALS and GLOXINIAS, together with a SPLENDID COLLECTION of BEGONIAS and GLADIOLI of the best sorts.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 10, at 12 o'Clock precisely.

On view morning of Sale, and Catalogues had.

Friday Next.

200 AZALEA MOLLIS, 150 A. INDICA, 100 CAMELLIAS, and 40 CITRUS SINENIS, from Belgium; 140 plants of ASPARAGUS PLUMOSUS NANUS, 70 lots of choice STOVE and GREENHOUSE FERNS, including a few specimens.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE on FRIDAY NEXT, February 10, at 12 o'clock.

On view morning of Sale, and Catalogues had.

The Studley Castle Collection of Orchids, Palms,

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 4, 1893.

A PROFITABLE INVESTMENT.

THE chief features, topographically, of Sussex are the rolling hills and winding valleys, the former abounding in iron of the finest quality, while the rich alluvial soils of the latter afford some of the richest pastures in this country. Horticulturally, too, Sussex can boast of some good investments, notably in the neighbourhood of Worthing, where certain pioneers of Tomato, Cucumber, Grape, and Fig growers for the London markets are to be met with; but the best of any that I have observed are in the neighbourhood of Balcombe, one of the very prettiest parts of the county. Now, Balcombe is not specially favoured beyond many other parts of the county in regard to soil, the staple consisting of a strong clay loam overlying the native sandstone rock, is an excellent one for Lily culture. Oxide of iron exists abundantly in the heavy clays and clayey loams; and whether the special success attained in the culture of Lilium speciosum album at Balcombe can be traced to this fact, I am unable to say. The spot, a garden of just under a quarter-acre, is attached to a cottage near to the station.

Some five-and-twenty or thirty years ago a few bulbs were grown in pots and allowed to flower out of doors; and this method was continued till the pots became too many to be properly attended to, when a number of them were turned out into the soil of the garden. Here they produced such fine flowers, and in such quantities, as to quite astonish the owner, who then turned the whole of his stock of Lilies out of their pots into the ground.

I had better say here, that this garden is planted with standard Apple trees, which more or less shade the garden. From this time a thorough systematic course of culture was adopted. The stock was taken up and replanted in rows beneath the trees about 10 inches apart in the row, and the rows 1 foot apart. The rows formed narrow beds, with alleys 16 inches wide running between. Generous culture has been afforded these bulbs, and whenever they become crowded, the whole of them are taken up and replanted; but Mr. Bates says he does not mulch or afford manure in a regular manner, but that whenever he noticed a want of a stimulus to growth, something is afforded. Wooden stakes are placed at intervals along the rows, and strings are attached to them, to which the flowering stems are tied as growth proceeds.

Along the alleys upright stakes at intervals of 6 feet, and about the same in height, and opposite each other and across the bed a light lath runs, and is nailed to the tops of the uprights. This is to support a screen of canvas which is put on whenever any danger from frost is apprehended, for these Lilies do not begin to bloom until about the second week in September,

but it may also tend in no small degree to keep the flowers getting tainted by the drip or filth from the trees overhead.

As the flowers begin to open, the anthers are carefully removed to preserve the ivory whiteness of the blooms, and owing to the great quantity of bulbs planted on this small piece of ground there is plenty of work for Mr. Bates and his two daughters.

As the flowering period draws near, preparations have to be made for marketing the crop. This period is from the second week in September to end of October, but the past season it ran into the middle of November. Enormous as this is, considering the small area occupied, no trouble whatever is experienced in disposing of it, but rather anxiety and regret is yearly felt at the inability to supply their ever-widening circle of customers. Boxes, packing, and wrapping materials being all in readiness, the flowers are picked either in the early morning or late evening, this work being left entirely to female fingers to manipulate these ivory-tinted beauties.

Now for the actual results of this quarter-acre garden. Prices in the earliest week or two are not up to the average; at this time the range is from 1*s.* 6*d.* to 2*s.* per dozen; but as the season advances, the average prices run from 2*s.* 3*d.* to 2*s.* 9*d.* per dozen blooms. No doubt this is accounted for by the quantity sent into market by those growing their bulbs in pots, which would not be over when the first blooms from outside arrive; but as the end of September and beginning of October is reached, the competition is with outside flowers.

In the first week or two of sales, the quantities sent off vary from fifty to seventy-five dozen three times per week, but in the height of the season 150 to 200 dozen blooms three times per week have been sent off. The greatest number ever sent off was during the middle of the past season, when for one week at least 130 to 150 dozen per day were despatched, making an average of 840 dozen for this week—truly an astonishing quantity from such a small area of ground. The revenue from this small plot can thus be very readily arrived at by any one for himself. There are then still classes of beautiful hardy plants, which, if their wants were specially attended to, and a market created for them, cultivators would find it profitable to grow, especially at the present time, when growers hardly know how to make ends meet, owing chiefly to influences over which they can have but little or no control.

At the present time I have in my mind's-eye several plants, and, associated with them several sites—or, perhaps, more correctly—several districts, where those plants could be grown to perfection, and at figures quite as remunerative, as shown in the above case of Lily culture.

Why these things are not done more here by those who have both the means and opportunity, is a mystery hard of explanation. I myself can advance several reasons for this torpid attitude everywhere displayed to depart from beaten tracks or ruts, but should most likely be met at the outset with a blunt denial, or at least by an assertion that this or that would not do or would not pay. These, however, it would not be difficult to controvert, on the assumption alone that they had never been tried.

It is needless for me to point out the lessons which may be read by those willing to learn from the instance here given, or to point out the necessity for caution which it is wise to observe in every undertaking. In horticulture, as in all other branches of business, those succeed best who make circumstances subservient to them, and not allow themselves to be subservient to circumstances. *Pomum.*

New or Noteworthy Plants.

NERINE MUTABILIS (HUMILIS × PULCHELLA). *New gard. hyb.*

The beauty of its varying flowers renders this pretty hybrid, which flowered with R. A. Todd, Esq., at Honeyden, Foots Cray, Kent, well worth naming and recording. In growth it is fairly intermediate between the two species crossed; the peduncle 12 to 18 inches in height; pedicels 2 to 2½ inches long; flowers ten to fifteen in a loose umbel. Perianth irregular, five segments forming the upper portion, and one (which is curved on one side), the lower part of the whorl. Segments 1½ inch long; cleft nearly to the ovary; abruptly curved back at the tips; bright rosy-carmine with a bluish keel, which varies in different stages of the flower from lavender to light purple, the other parts of the flower also varying from pink to lilac. Style and stamens declinate; the style as long as the segments, the stamens rather shorter, both pale pink. The whole flower very attractive.

Perhaps we may say, luckily, there are but two or three plants of it, for if there were any quantity, it being so variable, it might have the misfortune to assist in making the same confusion as some persons have caused N. O'Brienii (pudica × Plantii) to make. Originally there were N. O'Brienii, N. O'B. carminata, and N. O'B. cœrulea, but these three have also since been called N. humilis carminata, N. h. cœrulea, N. carminata, N. atro-sanguinea, and many other names. The worst injury of all is cataloguing it as N. atro-sanguinea, which is a totally different thing, some three or four only of which were raised by me, and which is not to be obtained, although doubtless those who order the plant catalogued under that name expect to get it. *James O'Brien.*

CYPRIPEDIUM CALYPSO, CYPHER'S VAR. (SPICERIANUM MAGNIFICUM ♀ × BOXALLI ATRATUM ♂). *New gard. hyb.*

This is an extraordinarily beautiful variety, worthy to keep company with the *élite* of the favourite genus, and take rank with such handsome things as C. Calypso, Oakwood var., and C. Leeanum giganteum.

The upper sepal is round and flat; pure white, with an emerald-green base, a broad purple band extending up the middle, and fainter merging purple lines over the lower two-thirds on each side of the middle line. Petals nearly horizontal, wavy on the upper edge, greenish-yellow, strongly tinged with brown on the upper halves above the broad reddish-brown band, which traverses the middle of the petal. Labellum similar in colour to the petals, beautifully spotted inside. Lower sepal pale green. The general appearance is of a very fine Boxalli, with a large and highly-coloured upper sepal of C. Spicerianum magnificum. It comes from Mr. Jas. Cypher, Queen's Road Nursery, Cheltenham, who has no doubt grown it in his usually excellent manner. *James O'Brien.*

GLADIOLUS (HYBRIDUS) NANCEIANUS.

This new race of Gladioli (fig. 21, p. 131) is the result of a cross between G. Sandersii and G. Lemoinei, and has not only retained the long-lasting properties and the beautiful spot of the latter, but its flowers have reached dimensions surpassing those of the largest-flowering varieties of G. Gandavensis. The spike stands erect, with the flowers evenly developed, looking you straight in the face. The immense flowers somewhat resemble Orchids of the brightest hues and most curious designs, or rather a strange kind of Amaryllis, covered to the tip of the spike with flowers of a new race. Our illustration (for which we are indebted to Mr. Lorenz, of Erfurt, who offers seeds of this strain in his trade catalogue) well shows the general character of the flower. It is one in which the two spotted segments are at the lower part of the flower. In other cases these two petals are at the upper part of the flower, and this variation may be seen in some cases in different flowers of the same spike. The first notice of this section was on August 10, 1889, when Mr. W. E. Gambleton favoured us with a description of the first of this new race of hardy Gladioli. On October 4, 1890, p. 379, he continued his observations, and described several additional forms, supplementing his notes by further descriptions on October 31, 1891.

KEW NOTES.

Gustavia pterocarpa.—This large-flowered Myrtaceous shrub is now in flower in the Palm-house, where it has been cultivated since 1885, and has several times flowered. It is about 3 feet high, with an erect stem, branched, and clothed with long shining green lanceolate leaves. The flowers are Magnolia-like, 4 inches across, formed of five broad, concave, fleshy, ivory-white petals, tinged with reddish outside, and corona-like clusters of yellow stamens, which are curved inwards, as in some of the Passifloras. The flowers are fragrant, and they remain on the plant three or four days after opening. This species was introduced by Messrs. Linden, of Ghent, in 1861, and distributed under the name of G. Leopoldi. There is a figure of it in the *Botanical Magazine*, t. 5239. It is a native of French Guiana. The Gustavias are quite worth a place among cultivated stove plants; at any rate, the one here described, and several others, among them G. gracillima, flower under cultivation, and are decidedly attractive.

Freesias.

There is a large well-flowered group of Freesias in the conservatory at Kew, and there has been a similar group in this house annually at this time for the last five years. Mr. F. Garrett, the foreman in the flower-garden department, which includes the conservatory (No. 4), gives the following directions for the culture of these Freesias:—Never allow the soil in which Freesias are planted to get dry. Shake them out in August, and repot in 6 or 8-inch pots in a mixture of loam, leaf-mould, and dry cow-manure. The round corms, not the thin ones, are those which flower best. For an 8-inch pot, twenty corms are sufficient. Water immediately after potting, and then place them in a cool frame, where they can remain till the frost comes, when they should be placed in a heated frame or on a shelf near the glass in a greenhouse. They require as much sunlight as possible. Stake the plants early, and when the flower-spikes show, a little stimulant, such as Clay's Fertiliser, should be given. *W. W.*

A TRAVELLER'S NOTES.

(*Continued from p. 70.*)

Buitenzorg.—The agricultural garden is, as I have said, some 2½ miles out of Buitenzorg, and some 200 acres in extent. It is most interesting, and consists of large quarters of all kinds of economic plants. Here are made trials of plants said to be of practical use in the colony, and the result is duly reported on.

Large plots of Arabian and Liberian Coffee are in grand condition and look well, though a few small round light brown spots show that the disease exists, but still in too small a degree to be harmful. All kinds of Rubbers are largely represented, one of the best of which is the Hevea brasiliensis. Gambier is also grown, and a large plot of Ficus elastica is very interesting—large trees with their stems all notched and scarred where they had been cut for the sap.

Mahogany, Chinese and Assam Tea, Cacao, Pappaya, Eucalyptus alba (a handsome tree from

Timor), Vanilla, Coca, Pepper (always grown in the shade), Elais guineensis (the African oil Palm—a magnificent plot, containing four rows of splendid trees, many of the trunks being 3 feet in diameter, some seeding and some flowering), Oranges, Rice, the poisonous Upas tree, and many kinds of grasses, are amongst the sights at this place. One does not see a dozen trees or a hundred; the thing is thoroughly done, of each there is a large plot; of Coffee several acres. Cardamom and Cinnamon are also grown, and trials are just being made with Ipecacuanha (Cephælis ipecacuanha); it does not seem to promise very well. Besides the above, a small plot has been set aside for medicinal plants, two of each species of which are grown.

An extensive, well-filled laboratory, also fitted with its own gas, made from petroleum as at Buitenzorg, is at the disposal of the Director of this department; and also apparatus for making experiments with the products of some of the plants, such as dyes, the extraction of Gambier or of oil from the seed of the Elais, and the like. To the ordinary visitor, this agri-

Fig. 21.—Gladiolus Nanceianus, var. (see p. 130.)

cultural garden proves more interesting than that at Buitenzorg; it is practical, the other is scientific.

I arrived at Garvet on the evening of Feb. 2, and at once made arrangements to start for an extinct crater on the morrow.

Ascent of a Volcanic Mountain.

One of the most interesting things I have yet seen since I have been away, is the crater of Papandaya, an excursion to which I made on the morning of Feb. 3. I left the hotel at Garvet at 4.30 A.M., in a small cart, miserably equipped. We were two hours reaching the crater up a very steep rocky path. I never should have thought a pony could have got up. At first we went through some cultivated grounds, Castor Oil, Maize, and several acres of Arabian Coffee, in grand condition, the ends of the shoots covered with bunches of berries. I looked for disease, but saw none. The plants were much higher than those I had seen in Ceylon, and the foliage of the richest green; it was so high and so thick one could only see a few yards into the plantation. Enclosing a plantation of Maize was a clipt hedge of Brugmansia, the flower was not much, but the foliage was a delightful green, growing freely. The hedge was kept pretty straight by long pieces of split Bamboo, tied lengthways to the main stems of the Brugmansia. Goldfussia isophylla, treated in the same way, I also saw used as a hedge-plant. Lantana was very frequent, and a pretty Cassia, possibly C. fistulosa.

We soon got through the cultivated portion of the hill, and into the jungle proper, the finest I have yet seen by a long way, certainly thicker and more luxuriant than in Penang. The Tree Ferns 1500 feet from the base, and to about 1000 feet from the summit, were magnificent. I think they were Cyatheas; their stems were often 20 to 30 feet high, one I noticed in particular, could not have been less than 50 feet. It is now the wet season in Java, and these Ferns were growing freely. It was a wonderful sight to look down on them, the rosettes of young fronds had been produced in such rapid succession, that they were apparently all of the same age, and were actually of the same tint of light green; the next lot to succeed them, usually six or seven, stood up straight, all about the same height, from 1½ to 2½ feet. What I wish to convey is, that one frond was not produced a long time after the other, as at home. Near the top many acres of the jungle had been burnt, but though the stems of these Tree Ferns were quite charred, they were yet growing; nothing else in the whole charred forest, except a few dwarf Ferns, had started. It was very curious to see the pale green of the young Tree Fern foliage, probably the only living thing there, standing out against the background of burnt black and brown wood, a clump of about two dozen in one place was particularly striking. Of course, one could not see far, the burnt trees were too thick, and frequently tangled masses of climbers hung from branches like thick curtains, rendering it still more impossible. At the base of the hill a large Bamboo was magnificent, perfectly impenetrable, but it soon ceased, and did not seem to grow more than a few hundred feet up. This also applies to Plantains. The vegetation on both sides of the rough rocky road was most thick, quite impossible to enter without clearing; in some places one could only see a few feet into it, most scarcely a score of yards, and where the Gleichenia carpet hung down, not 6 inches. This Gleichenia, not as common or as frequent on this hill as in Penang, must be either G. flagellaris or G. dichotoma; I did not see G. longissima at all.

The path, as I have said, was very steep, the ground rising on one side and falling away on the other. Where it fell away to a considerable depth, a glimpse might be caught over the thick jungle for some distance. This sort of view was more particularly obtained where water was descending the hill. Passing over such streams (they were not large) and looking down the ravine, I saw as luxuriant and rampant a vegetation as I ever dreamed of. Some of the tree stems were large (these probably belonged to the Dipterocarpeæ), but it was not the rule, thick undergrowth being more general. Many of the stems were covered with epiphytes, and high up in the branches above I saw many more either epiphytes or parasites. Many Ferns were thus growing on stems, and also a small climbing Fig. Asplenium Nidus was magnificent, completely encircling some trunks, its thick masses of dead leaves hanging down often 6 to 7 feet long; it was most frequent, but never had that regular circular appearance it gets in a pot at home. The other Ferns were numerous, but not striking, except one, a Blechnum, much like brasiliense, its young leaves often 2 feet long, tinted red; it is a fine thing. The vegetation generally was very varied, but generally, when looked at closely, of no especial beauty. The creepers were very numerous, and often hung from the branches above in tangled masses of dead and living vegetation—dead very often. Why, I do not know, for there seemed to be no reason. I also saw a very weak sickly-looking Nepenthes, and of that but two specimens.

As one nears the crater, and at about 800 feet below it, all this richness ceases, and the path and surrounding land changes to bare rock, on which nothing is growing but a low shrub like a Myrtle. The path is now very rough; now passing between huge boulders, evidently rolled off the mouth of the crater, and pitched at some time or other headlong down; and now over flatter ground, on which are small pieces of sulphur, lava, and a whitish stone not unlike chalk. The crater is about half a mile in diameter, completely enclosed on three sides, and open to the country beyond (of which a lovely view is obtained) on the fourth. One side of the mouth, about 400 feet high, has a little scant vegetation, but it is not easy to get there to look at it. The other two are completely bare, sheer precipices of rock, from 300 to 400 feet in height. The fourth side slopes, so far as I could judge, by a series of small plateaus to the plain beneath, but, of course, all one sees is the top of the jungle, the paddy fields below, and a hill of wonderfully even pyramidal shape beyond. The crater proper is interesting. There is probably not a living thing in the place—bird, insect, or reptile. In one place volumes of smoke, so dense that one cannot see through it, pour out and reach even the top of the mouth of the crater; the ground round the hole where it comes from being thick with golden-yellow sulphur, a lovely colour. The main volume of smoke, which comes steadily forth, must be 40 to 50 yards in diameter; and besides this, there are several smaller ones. Boiling water bubbles and hisses out in places, and in one spot hot air rushes out with a noise like a locomotive safety-valve. On approaching this, and hearing the noise, I looked for a waterfall, and was considerably astonished to find the noise produced by the escape of sulphurous air; the pressure beneath must be pretty considerable to make such a sound.

The whole scene was very interesting, beating that which I saw near Naples easily. The floor of that crater was more or less covered with vegetation, but in this case there was nothing but a rough uneven surface, in some places covered with loose stones of all sizes; especially was this the case at the base of what appeared to have been a landslip from one side of the mouth—huge boulders in most extraordinary positions were common at this point.

Coming back from the foot of the hill in the same carriage, I had a good view of the country—wonderfully rich and fertile—for the whole way, about ten miles; on each side of the road the land was under cultivation, all "paddy" of kinds. The Rice is plucked by hand, tied in bunches, and carried by coolies on their Bamboo rods, several bunches being made into a bundle, and suspended by a string. The rods, about 6 feet in length, are carried on the shoulder, with an equal weight attached to each end. The coolies usually travel, when thus loaded, at a slow swinging trot.

The hotel garden at Garvet is rather pretty, and presents a curious mixture. Alternating with a row of Crotons are China Roses in pots, nicely in flower; and in another portion I noticed a large pot of Maranta between a mule Pink and an Ivy-leaved Pelargoniums. Sanchezia grows side by side with

Habrothamnus and Abutilon, all flowering freely. Tea Roses in large pots do well, and the Cocoa-nuts, many with fine fruit, look remarkably well. Garvet is 2200 feet above sea-level, and the crater of Papandaya nearly 5000 feet. It is not known when the latter last indulged in an eruption, but a crater which can be seen from the garden is said to have been active some fifty years ago.

Lake Bagendit.

On February 4, I made an excursion to Lake Bagendit, a most lovely spot. It lies in quite another direction from Garvet. The country, pretty flat for a few miles, was almost entirely under cultivation, chiefly Rice, apparently in the most splendid condition. Water is plentiful (at this season, at least), and no difficulty seems to be experienced with irrigation. We passed through several villages remarkably clean looking, especially when compared with the mud hovels the natives in the out-of-the-way parts of our own India live in. On each side of the main street was a neat fence of split Bamboo, strengthened with tarred string, all the little Bamboo houses on supports a foot or so from the ground, stand thick inside under under the shade of Cocoa-nuts and other trees. The entrance to the chief part of the village is marked by a small Bamboo gateway, like a small triumphal arch.

The lake I went to see is about an hour's drive from the hotel. On its shores are two villages, by one of which I reached the lake. By signs from the driver of my carriage, I understood I was to get out, and was subsequently conducted to the shores of the lake through the main street of the village. Here were several canoes, each being the hollowed out trunk of a tree. I soon espied a small summer-house arrangement, about 20 feet square, with a Bamboo floor, open sides, and pointed grass-roof. This, by the assistance of various men, women and children, was tied on to three canoes, a chair fetched, and myself duly installed inside.

We then rowed about the lake, two boys with short paddles being placed at each end. This lake is one of the loveliest spots imaginable. It is not large, but is surrounded by low hills, gently undulating, mostly under cultivation; behind these low hills rise the taller ones, some 3000 to 4000 feet above the level of Garvet.

On our return, I was struck with the beauty of the lake approach to the village, beneath its tall Cocoa-nut and Areca Palms. On landing, the head-man of the village appeared, and was paid the tariff price, 2½ f. The boatmen never expected tips, and if offered, would not have understood it. The other day I offered a man 2*d.* for following me up Papandaya for four hours, and he never understood it, so I finally laid it on the ground. I had heard of such things in out-of-the-way parts of India, but never yet met with it—it was quite refreshing; one of the advantages of coming to a place not spoiled by the globe-trotter.

At Garvet, early every morning the sky is clear, the sun hot, right overhead, and the weather pleasant. Between 8 and 9 A.M., white clouds, spotlessly white, begin to roll up the hill-sides; about 12 at noon, these become quite thick, hiding the hill-tops all round the basin in which Garvet and the fertile plains I have described lie; between 2 and 3, after a most oppressive heat, they break; and the same performance is repeated next day. *James H. Veitch.*

Foreign Correspondence.

GERMANY.

Hardy plants were hardly known in this country except in nurserymen's and private collections, till a few years since; at any rate, the real commercial value was not understood by our florists as it is now-a-days. Herbaceous plants, suitable for cutting purposes, are now in great demand, and the town florists at last have grasped the right idea in using them to the best advantage. Such plants as Gaillardias, Coreopsis, double and single Pyrethrums, Iceland Poppies, Marguerites, Chrysanthemums, &c., which can be cut with long stalks, are the general favourites. As our summers on the sunny banks of the Rhine are of crystalline clearness, the plants are much more vigorous, and the colours more intense than I ever noticed them to be during my long stay amongst hardy plants in a London establishment.

The first and foremost florist flower which shows a remarkable difference in this clear atmosphere are the varieties of perennial Gaillardias. They vary in colour from the brightest vermilion and richest crimson to the brightest golden-yellow, and I know of no other plant which will produce such a quantity of blooms from early June until severe frost cuts it down. Each plant when thoroughly established measures 3 feet or more across, and carries hundreds of flowers at one time. The various dazzling colours in the bright sunshine is a sight more easily imagined than described. The flowers are especially adapted for cutting, lasting for more than a week in water. The plants are easily raised from seed, and if sown in March will flower the first summer. Lychnis flos cuculi alba plena is one of the most exquisite hardy perennials, and the most beautiful of this genus. The elegantly snow-white flowers have a charm and fascination peculiarly their own. The rich glistening reddish stems and calyx supporting those beautiful snowflake-like blossoms form a charming contrast. For pot-work and cutting purposes it should be largely grown, and ought to be found in every garden where hardy plants are appreciated *C. Sonntag, Rhine Nurseries, Hilden.*

BELGIUM.

Orchids in Belgium.— The severe frosts from which we have suffered here during the last month prevented the holding of the Ghent horticultural meeting, and the meeting of the Brussels Orchidéenne. In certain parts of the country the thermometer registered 25° C. below zero (= 13° F.). This severe weather threatens to have a very disastrous effect upon horticulture.

Cypripedium × *memoria Mœnsi.*—This new hybrid may be best described as a red Leeanum. The dorsal sepal is most conspicuous and remarkable. It is large, and the edges are folded back a little, as in Leeanum; in colour it is bright rosy-scarlet, slightly inclining to purple, with a central longitudinal band of darker red, and a light bordering of white at the top. The petals are bright reddish-brown; at their extreme base is a narrow patch covered with small black specks. The petals are divided into two halves by a dark brown line, and the lower half is slightly lighter than the other. The lip is large, and rather square in shape; it is shining reddish-brown in colour. The staminode resembles, on a larger scale, that of C. Spicerianum; it is pale mauve, the edges a little brighter in tint. This hybrid, so fine and peculiar in colouring, is certainly one of the most beautiful that we have hitherto seen. [Since this was in type we have received an original description of this hybrid from M. Desbois. Ed.].

Cypripedium × *Lucianianum.*—The dorsal sepal of this hybrid is exceedingly fine; it is very large and remarkably bright in colouring, with many conspicuous spots of reddish-brown or violet on a white ground. At the base is a clear green space marked with reddish-brown stripes; the spots at the base are particularly large. The petals are broad, slightly curved inwards; the large lip is bright mahogany-brown. This new hybrid is almost unrivalled except in the Stonei and Rothschildianum group, in size and colouring; its success is assured. In habit, moreover, the plant is very robust. This hybrid is named after M. Lucien Linden, director of the Horticulture Internationale.

M. Jules Hye-Leysen, of Ghent, has now a plant of Cypripedium, Ch. Canham, bearing seven flowers; certainly larger than those of any other hybrid Cypripedium. This magnificent plant is as effective as a well-bloomed Cattleya.

In the houses, we noted the following as being especially interesting:—Odontoglossums amabile, Chestertoni, and guttatum splendidum; also a Cypripedium Albertianum, from some of the same seed from which came the specimen, of which a coloured plate was published in the *Revue de l'Horticulture Belge et Etrangère;* the new specimen is darker both in the lip and on the sepals than was the former.

In one of the houses of the firm of Ed. Pynaert Van Geert there is also in flower a plant of this same hybrid (C. Ch. Canham), but the flowers are handsomely marbled and mottled, like those of C. Dauthieri marmoratum or C. Harrisianum polychromum. The flower is smaller than that of the type, but still of a good size, nearly 5 inches in each diameter. The same firm has also a C. Chamberlainianum of excellent colour; the upper sepal flat and rounded; the petals evenly marked along their length by purplish-mauve lines; the lip dark carmine bordered with pale green.

Mr. Alfred Van Imshoot, had on January 16, thirty-two species and varieties of Orchids in bloom in a cool-house 7° to 12° C. = 45° to 55° F., and more than fifty in a warm-house (15° to 20° C., 60° to 70° F.). We noticed among others a very remarkable variety of Oncidium cucullatum var. Phalænopsis, with a deep purplish spot on each petal; O. tigrinum var. unguiculatum, with a stem 8 feet long; a bright pink Masdavallia Barlaeana, M. Parlatoreana, from M. Veitchii × M. Barlaeana, Amblostoma tridactylos, with large clusters of small white flowers; Oncidium splendidum, with a fine group of about thirty-five blooms; Brassia Lawrenceana var. longisissima, the finest of all the Brassias, the petals golden-yellow, and 12 to 13 inches long; Zygopetalum brachypetalum, a very fine variety, the petals are claret-coloured, the lip bluish-mauve; Z. graminifolium, the petals brown, mottled with green, the lip almost blue; Brownleea cœrulea, a very pretty terrestrial Orchid, with blue flowers, spotted with black; Phalænopsis Micholitzii, a rare variety, the flowers pure white; a beautiful variety of Vanda Cathcarti, &c.

In addition to Odontoglossum, M. C. Vuylsteke, of Loochristy, has bloomed during December several new hybrid Cypripediums, notably C. × Murillo (F. Desbois), a hybrid between C. Boxalli atratum (female) and C. Argus (male); C. Erato (F. D.), from C. Sallieri and C. hirsutissimum; C. Jupiter (F. D.), from C. Boxalli atratum × C. hirsutissimum; C. Eucharis (F. D.), from C. insigne Chantini × C. Lawrenceanum; C. Zampa (F. D.), from C. Leeanum superbum × C. hirsutissimum; and C. villosum violaceum, from C. villosum × C. hirsutissimum.

In the Brussels Botanic Garden there are now in bloom two Maxillarias not very common in cultivation, and partially described by Lindley from herbarium specimens. M. longissima (Lindl.), is a curious species from the forests of Merida. M. pentura (Lindl.), of similar origin, is very like the preceding species, but smaller; the flowers are less numerous, the sepals clear yellow, the petals pure white. Finally, in the same botanic garden, I noticed a new hybrid Cypripedium, C. Kerchovianum, obtained from a cross effected in 1887 between C. Curtisii × barbatum nigrum, and named after the president of the Société Royale d'Agriculture et de Botanique de Gand, M. le Comte de Kerchove of Denterghem. It flowered first in December, 1892. The upper sepal is broad, spreading, even, bright pink striped with green and purple, edged with pinkish-white; the base clear green; lower sepal smaller, oval, acuminate, striped with green; petals oblong, spreading, slightly ciliate, reddish-violet towards the tips, moderately broad, very dark at the base, ending in a white tip; the lip large, widened in the centre, in colour very dark violet-purple; lateral angles obtuse; staminode horseshoe-shaped, deep pink with a green centre; peduncle long; pubescent reddish-black; leaves oblong, from 8 to 9 inches long, clear green, spotted with dark-bluish green. *Ch. de Bosschère.*

FRANCE.

Hybrid-Palms.—I am sending you some notes on hybrid Palms, which, perhaps, may be of interest to the readers of the *Gardeners' Chronicle.* We have here female Phœnix senegalensis, and no males, yet they fructify abundantly, and, as they are near some male P. canariensis, evidently by the action of the pollen of these latter. Doubtless bees or other insects are the agents of this fecundation. The genus Phœnix is so natural, that all the species are capable of fecundation one with another, thus still further augmenting the difficulty of distinguishing between them, which, apart from this, is not inconsiderable; still I did not wish to chronicle this, but

a rather more interesting fact relating to Microphœnix, of which you have already heard some years ago. This Microphœnix was obtained, some say, from Chamærops humilis, fecundated by the Date - Palm. Having attained adult age, it has been again hybridised by Trachycarpus excelsa (or Fortunei) by our friend Sahut, of Montpellier. This Microphœnix Sahuti × was obtained with a distinct physiognomy, remarkable among other peculiarities for the black colour of the base of the petioles, which is, it seems, exhibited by certain varieties of Date-Palms. Its fruits, or it is beginning to fructify, are more elongated than those of the ordinary Chamærops; in fact, it is difficult to tell whether we have here a hybrid plant of three species and three genera, or if its unusual form is merely the result of possible variations of the classic Chamærops humilis. The question is involved, but perhaps in the future will be disentangled. We shall see.

Another question not without interest is that relating to the Carob (Ceratonia). Botanists who have studied it have not noticed that there are sterile long-stamened specimens, and other hermaphrodite plants, which have such short stamens that they have always been believed to be female. The stamens of these are, in fact, so short that it is difficult to find them unless previously aware of their existence. Now, it is these quasi-abortions which fecundate the ovaries, and it is hard to see why the male long-stamened plants are placed so far away from the hermaphrodite specimens for which they are needed. Are the insects the medium here, as in the case of the Carob? We scarcely see how they can be attracted by such inconspicuous, apetalous flowers, and still less how hermaphrodite specimens suffice perfectly to produce fruits. It cannot be for nothing that Nature has made the male Carobs long-stamened. Dr. Heckel, of Marseilles, has recently published his observations on these peculiarities. The Provençal peasants, who are aware of the sterility of the long-stemmed Carobs, destroy them as useless. Are they right? That is the question. *Charles Naudin, Antibes.*

Fig. 22.—Dracænopsis [alias cordyline] australis at Belgrove, Cork.

(From a photogram by Major Lysaght.)

DRACÆNOPSIS AUSTRALIS AT BELGROVE, QUEENSTOWN.

The plant of which the accompanying woodcut (fig. 22) is a faithful and accurate portrait, has been growing in the grass in front of my house on a sheltered branch of Cork Harbour for about twenty years, but I have no record of the exact year in which it was planted. It is specially interesting, from having been killed to the ground during the severe winter of 1879—80, after which it immediately sent up six stout stems, which are now about 15½ feet in height. A seventh stem is about half this height. It has never received any kind of protection, and has not in any way suffered during the winters that have intervened since it began to grow again. The plants appearing alongside it in the engraving are Yucca recurva, Kniphofia Northiana, already figured in the *Gardeners' Chronicle*, and Gynerium jubatum, by far the most beautiful, but, alas! also the most delicate of all the varieties of Pampas-grass. *W. E. Gumbleton.*

SELECT DECORATIVE FOLIAGE PLANTS.

(*Continued from p.* 40.)

Ficus elastica.—This useful old plant still retains its popularity as a decorative plant. Under fair treatment, it will thrive as well indoors as when grown in a greenhouse, and it is only when it has grown too large that it has to be replaced. The variegated variety is very effective when well coloured, but it is not quite so hardy as the normal form. Although it is now some years ago since the variegated variety was first introduced, it is not until quite recently that it has become popular. Two or three years ago the American horticulturists took it in hand, and appear to have bought up all they could find in this country. This stimulated the English growers, many of whom now grow it in large quantities. As in all plants where the variegation is marginal, it requires some care to keep the leaves in good condition. Too much moisture on the foliage, especially in a low temperature, is sure to cause the white portion of the leaves to discolour. I have seen plants from 4 to 5 feet high, with perfect leaves down to the base of the plants; and in the older leaves the variegation is more distinct than in the newer ones.

The best time for propagating the Ficus is early in the year, before the plants begin to start into new growth. Tops taken off with four or five leaves, and put into small pots singly, using plenty of dry sand at the base of the cuttings, will root freely in the stove or propagating pit. It is essential that there should be a good brisk bottom-heat. They may be potted on in any ordinary compost, but good mellow loam with a little well-rotted manure will produce the best results.

I may here refer to Ficus repens, a plant which deserves to be much more grown that it is at the present. For hanging-baskets, walls, or as an edging to a greenhouse stage, it is a most serviceable plant. Many Ferns which make fine basket plants do not cover the lower surface of the baskets, and to clothe these there is no better subject than F. repens; it may also be used to hang down in long sprays. It also provides good foliage for the shower-bouquets, which are now so fashionable. Plants growing against a wall in a shady position in an intermediate-house provide the best material for this purpose. In a dry atmosphere this Ficus is slow of growth, but when well established on a moist wall is grows very rapidly. Cuttings from the tips of young shoots root freely in heat, and for growing in pots, about six cuttings put into a small pot, may be potted on after they are established without dividing them. Grown on in 5-inch pots they make useful plants for edging. It is of free growth, but a dry atmosphere or cold draughts will cause the young leaves to curl up, especially early in the spring. F. repens minima is a variety with much smaller leaves.

F. falcata is another slender-growing species, with small deep green foliage. This does not grow so rapidly as repens, or, at least, as far as my experience goes, but if grown on a moist wall in the stove it may prove more robust.

Agapanthus umbellatus minor variegata is a very pretty variegated plant; the leaves are much

smaller than the ordinary A. umbellatus, and are of a glaucous grey, with white stripes. The only objection to this plant is its large, fleshy roots, which require rather large pots in proportion to the size of the plants. It may be increased by division, and to keep them within limited-sized pots some of the fleshy roots may be cut away. This Agapanthus is particularly valuable, as it does well in a dry cool greenhouse, and requires very little attention.

Coprosma Baueriana variegata is another pretty variegated plant for the cool greenhouse, or may be used for bedding out during the summer. The bright fresh green, with a creamy-white variegation, is very effective. May be propagated from cuttings in spring. The cuttings should be short, and only put into the soil just deep enough to keep them firm; or it is, perhaps, better to use a small stick to each cutting, and put the base of the cuttings on the sandy surface of the pots—they must be kept quite close, and require a moderate bottom-heat; the plants may be potted in any light sandy compost. To make good bushy plants they must be stopped from time to time as they require it. *O.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Pickering Lodge, Timperley.*

ORCHID SEEDLINGS, ETC.—Seedlings of Dendrobiums which may have been rested a few weeks will be better if started at this period, so that a long season of growth may be before them. Any plants of Cattleya labiata, C. Warneri, and C. maxima that were rested at the cool part of the Cattleya-house, may be removed to the warmest part of the house, if such exist; if not, the plant-stove will be a very good place for them, the plants being now engaged in making growth top and bottom. It is very necessary to be careful with the watering of these plants at this season, and I find that they will do best if placed in baskets and hung close up to the roof-glass. Those that require re-potting or only top-dressing had better be taken in hand forthwith. Let good peat, clean crock, and charcoal be used, and let the plants occupy a place on the south side of the house, C. labiata being a rather shy flowerer if not well matured the previous year.

HINTS ON WORK IN THE HOUSES.—Vanda tricolor, and varieties of it that may require repotting or top-dressing, should be attended to before new roots form, the same potting material being used for them as, in a former Calendar was advised for Aërides, but potting them a little deeper than those, and not watering for about three days afterwards, when it should be thoroughly done. The stems may be syringed daily, which will assist the leaves to remain plump and green, Vandas losing their beauty when the lower leaves fall off. A good place for them is the cool part of the plant stove, on a bed of finely-broken coke or coal ashes kept in a moist state. After having potted them, get the house-blinds ready for running down over them for a few hours during the sunny part of the day, as the plants are impatient of bright sunshine.

PHALÆNOPSIS SCHILLERIANA AND P. AMABILIS. These two species will need special attention, both now being near the flowering period. The flowering of Phalænopsis seems to exhaust their energies greatly, therefore, everything with regard to the right temperature, the amount of moisture in the house, and bottom ventilation when needed, always avoiding cold draughts, must receive careful attention. The ventilators should be opened according as the temperature outside is high or low; and a good kind of inlet for air is made with a finely-perforated zinc plate nailed over the ventilator on the inside, so as to break up the current of air entering the house. Water the plants sparingly at present, just keeping the moss green; and syringing amongst the pots once a day, taking the precaution to have no stagnant air in the house or round about them. After the whole of the flowers are fully expanded—which will be about a fortnight after the first flowers open, do not let the spike remain much longer on the plant, but cut it off, as the plant having nothing but roots and leaves from which to draw support, there being no pseudobulbs, they often become weakened and die when the flower-spikes are allowed to remain. Small plants should have the flower-spikes cut off for a season or two. "Spot" on the leaves is the chief evil which has to be contended with, but it is my opinion that this malady is due to want of fresh air, which in a hot, and moist, shady house causes the leaves to be very soft in texture and immature, when the smallest cause will induce what we know as "spot." I find wooden cylinders best for Phalænopsis. Pots require to be frequently washed, thereby injuring the roots; baskets must be hung up to the roof, whereas cylinders can be placed in pots on a stage, and are usually made deeper than pots—thus, the plants are brought up to the light; and, again, the roots seem to take more freely to the Teak-wood bars, and cling to them well. During the last week or two a great change has taken place in the weather, less fire-heat having been required, and more air has been admitted, which has benefited the plants. The temperature at night may remain as previously advised for a few weeks longer, but a rise in the day warmth by sun-heat alone will do no harm.

THE FLOWER GARDEN.

By T. H. CRASP, *Gardener, Canford Manor, Wimborne.*

RHODODENDRONS.—These plants may justly be classed amongst the most beautiful and attractive of evergreen flowering-shrubs. The foliage is always attractive, and they flower in the greatest profusion where the plants succeed, and none is more showy when in flower than the beautiful cross-bred varieties raised from Rhododendrons ponticum, Catawbiense, caucasicum, and others. They succeed well under a variety of conditions, if the soil contains no lime or chalk; and, as a rule, a moist situation, with partial shade, suits them best; a position not always attainable, or even necessary, as they grow and flower splendidly in sunny positions. The soil best suited to Rhoddoendrons is one consisting of peat and decayed leaf-mould, but the Pontic varieties do very well in one containing a large amount of fibry, sandy loam, provided lime be absent from it. If the transplanting or making of new beds of these shrubs are contemplated, there should be no loss of time in pushing on with operations in open weather. In order that the plants may do well it is generally necessary to have specially-prepared beds made by taking out the staple soil to the depth of 2 to 2½ feet, replacing it with two-thirds peat, if plentiful, or of leaf-soil, and one-third good fibry sandy loam with a small portion of dried cow manure. In moving the plants to their new positions, care should be taken in having a ball of earth large enough to hold all the roots; and after planting them, the bed should have a thorough watering. All Rhododendrons have small hair-like roots, which are found near and on the surface of the soil; it is, therefore, very important that they should receive protection from direct sunshine and frost. If the amount of foliage does not suffice for these purposes, the beds should be top-dressed with half decayed leaf-mould, or similar substance, which will be found of great benefit in keeping the roots cool and moist in the summer time, and uninjured by frost. Plants moved now, and treated in the manner indicated, will not show the effects of transplanting, but continue to flower and grow as if no disturbance had taken place. The same remarks will apply to Ghent Azaleas, hardy Ericas, Kalmias, Ledums, Menziesias, Andromedas, &c. The work of transplanting and making new beds for these may now be undertaken. Where there are beds of these plants, these could be improved and brightened up greatly throughout the summer, when the plants are out of bloom, by planting Lily bulbs between the plants, such as L. auratum, L. speciosum and its varieties, L. pardalinum, L. candidum, and many others which grow wonderfully well in the soil which suits American plants, the former getting partial shade from the sun in summer, and protection from frost in the winter—a condition of things very essential to the well-doing of most Lilies, and when they are thus managed, they scarcely ever require any further attention for some considerable time. In planting the bulbs, care should be taken in arranging them according to the height that they grow, so that the blooms may be seen at a fair distance away, otherwise the effect of the Lilies when in bloom will be marred to a certain extent.

IXIAS AND BABIANAS, &C.—These beautiful little bulbous plants, the flowers of which are so useful to the gardener who has to furnish large quantities of cut flowers, on account of their lasting so long in water after being cut, may now be planted. The most successful way of growing them outside is to make a raised border of good rich soil, planting the bulbs about 4 inches deep, sprinkling a little sand on them, and after filling in the holes, covering the bed with cocoa-nut fibre or partly-decayed leaf-soil to the same depth, which may be removed towards the end of March. They will also do very well on a well-drained sunny south border. In very warm sheltered positions the bulbs may remain all the year round without loss; but the best and safest method is to lift them late in the autumn and store in sand, planting at the present time. Propagation can be readily effected by seeds, but a much quicker method is by offsets, as the bulbs then flower the second year; but in the case of seeds, it would require three or four years. Plenty of these offsets can be obtained from the parent Ixias, when they have ripened-off in the autumn, and should be treated in the same manner as those. Helleborus niger and its varieties, more popularly known as Christmas Roses, are largely cultivated for the beautiful white flowers the plants produce at mid-winter. They thrive well in ordinary garden soil, but a rich loam, with a rather moist shady situation, suits them best. Propagation is readily effected by division, which should be done at this time of the year, taking care to select the healthiest and strongest clumps for this purpose. Plants that have been forced could also be utilised. All the plants at the end of March should have a top-dressing of rich, rotted manure, which will tend to strengthen them greatly. Where the planting of beds of Ranunculus and Anemones is contemplated, no time should be lost in preparing them by digging-in well-rotted cow-manure and leaf-soil, and planting the corms about 4 inches deep, afterwards giving the beds a good mulching with cocoa-nut fibre refuse.

PLANTS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

BAMBUSAS.—Where these are grown for house or other decoration, they should be divided and re-potted at this season, using clean well-drained pots, good loam, leaf-mould, and plenty of rough sand. A good supply of manure-water when the roots fill the pots will help them to "feather" well. Bamboos are amongst the most useful of decorative plants that we have for halls and corridors.

CYCLAMENS.—Careful attention must be paid to the watering of these plants, always waiting till the plants are dry, then affording a thorough watering; tepid liquid manure may be occasionally used. The best place for Cyclamens is a wooden shelf or trellis near the glass in a greenhouse. Keep them clear of aphis and thrips, dipping or syringing them in or with a solution of Lemon-oil and warm water, as formerly recommended.

TUBEROUS-ROOTED BEGONIAS AND GLOXINIAS.—These may now be potted and started in gentle heat, using as potting compost loam, peat, and leaf-mould in about equal proportions, with a small quantity of rich, decayed manure, and plenty of rough sand. Seeds should be sown of these plants as soon as possible. Begonia Weltoniensis and its varieties, if they have been turned on their sides and kept dry for a time, will require attention. First, the plants may be stood in a moderately light place in a house with a temperature of 55° to 58° at night, affording them water sufficient to wet the ball thoroughly; and when growth recommences, they may be shaken out and re-potted. The best of this class of Begonias is Knowsleyana.

FUCHSIAS.—Re-pot and prune such of the plants as are starting into growth, affording them a place in the Peach-house. Standard Fuchsias are very effective, and they show off their flowers better in that way than any other. These should now be pruned, and almost any Fuchsias with good stems will do for standards; they soon form good heads. Cuttings of Fuchsias may be struck as soon as shoots a few inches long can be found; but the best time to strike them is July or August, the young plants being kept growing throughout the winter, and these, if grown in good rich soil, with a liberal supply of manure occasionally, make good specimen plants the following summer. Fuchsia cuttings at this season strike readily in a moist, warm bed of 70° top-heat and 80° bottom-heat.

STOVE PLANTS.—Anthuriums are among the most useful of plants for stove decoration or exhibition purposes. A. Andreanum produces its spathes during the winter months, and is a very telling plant when grown in 6 or 8-inch pots, being useful also for filling vases, &c. It is a plant easy to cultivate in turfy peat and sphagnum moss in about

equal parts, with plenty of sand mixed with these; and good drainage. When the plants get tall and the stems are bare of foliage, a handful of sphagnum moss tied tightly round under the leaves, and kept moist, will soon induce roots to form, when the top may be cut off and potted, it making a good plant at once; or several can be placed in a large pot or deep pan to make a specimen. A. Richardi and A. Scherzerianum and their varieties are readily increased by divisions. Some of the best of the ornamental foliage section are A. crystallinum, with bright green leaves and white veins; A. Veitchii, and A. Warocqueanum, with large metallic Zulu shield-like leaves, 3 to 4 feet long, 12 to 16 inches broad. These varieties like large pots, good drainage, and a compost consisting of turfy loam, peat, and sand, with a strong moist heat, and a plentiful supply of water, and shade from bright sunshine.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

TOMATOS.—Seeds should now be sown to produce plants for planting in heated structures. Nothing is gained by sowing thus early by those who have not properly-heated houses to grow the plants in, for unless they are kept near the light to prevent them being drawn, they soon spoil. A dry warm atmosphere suits the Tomato best, and for early fruiting there is no better plan than to train them near the glass. Long strong growth is not needed for the production of a heavy crop of fruit, but such as is short, firm, and solid. On this the fruit sets more readily, the clusters are larger, and the fruit more solid; so that if the plants become drawn in their early stage, they are weakened, and good results are an impossibility.

SEAKALE.—Continue to take up batches of roots for forcing, to meet the demand; and, as they will now start more readily into growth than formerly, the time occupied in forcing will be less. All roots of about the thickness of the little finger should be saved for making sets. If these are cut into lengths of 3 or 4 inches, making the cut at the upper end straight across, and that at the lower diagonally, this will at once show which end is to be planted downwards. For though Seakale will grow from any bits of roots, it grows more readily when planted in the same position as it grew. The new Seakale quarter should be well manured and deeply dug if good crowns are required early in the autumn. Before planting, dress the soil with nitrate of soda, or if this cannot be procured use common salt, and do not plant the sets deeply, only covering them by about an inch to an inch and a half. The sets should be planted in rows 2 feet apart, 9 inches being allowed between each set in the row.

RHUBARB.—Roots planted in warm situations in the open ground will soon be starting into growth, so that if they are covered with pots, and a little fermenting material placed round these, the stalks will be sufficiently advanced in a short time as to be fit for consumption. Those roots which were taken up for forcing indoors, and are become exhausted, should be taken outside and covered with leaf-mould or litter so as to exclude frost and air, and be broken up, each bit with a bud, for planting towards the end of the month.

POTATOS.—A batch may now be planted in cold frames or on warm open borders where they can be protected from frost. These sets should be planted wider apart than those in heated pits. A distance of 18 inches between the rows, and a foot apart in the row, will not be too great for planting out-of-doors. Better results are obtained by allowing them plenty of room, especially if the ground be in good heart. For the Ashleaf kinds the soil cannot be too rich. Earth-up those in warm pits and frames, as they become sufficiently advanced in growth, using a light rich soil which has been raised to the same temperature as the soil of the bed. Take care not to allow cold draughts to come into contact with the foliage, which is very tender and susceptible to injury from that cause.

PARSNIPS.—A sowing may be made on light well-prepared soil, as soon as it gets into a workable condition; but where the land is heavy, it will be better to defer sowing for a short time, as the seed if sown, would most likely perish. Where the land is retentive of moisture, it is better to sow Parsnip seed on slightly raised ridges.

SMALL SEEDS.—If a raised bed, 18 inches to 2 feet thick, be made with fermenting materials, and covered with about 6 inches of light soil, Carrots, Brussels Sprouts, Cauliflowers, Cabbages, Lettuces, Savoys, and Mammoth Broccoli may be sown, which will soon germinate; they should be protected at night and also by day, if it be cold or the wind is boisterous. A sowing of the above may also be made on a warm border.

TURNIPS.—Make a sowing of Extra Early Milan on a warm south border; the seed should be protected from birds, which are very troublesome at this time of the year, especially if thick hedges, plantations, &c., are in the vicinity of the garden.

PEAS.—Second early kinds may now be sown in the open ground. I prefer Duke of Albany, Empress of India, Early Marrow, Windsor Castle, and other Marrowfat Peas, these being of excellent flavour. Sow in drills 7 feet apart or more, and take a dwarf crop of some kind off the land between the rows, such as Turnips, Spinach, Lettuces, or early Cauliflowers. By arranging the ground thus, Celery may be planted between the rows of Peas after the other crops are off, and before all the Peas are gathered. Another crop may be taken from the ground which the Peas occupied, immediately afterwards, but this necessitates judicious manuring to keep the soil in good heart.

STORE ROOM.—If Potatos for seed are not already stood up ready for sprouting, this should be done without further delay. By so doing, much stronger growths are obtained, even with late kinds, which materially increase the crop. See that those intended for consumption have all the eyes removed as soon as seen. Parsnips, Carrots, Beet, Hamburgh Parsley, Salsafy, Scorzonera, &c., in store should be kept free from growth.

FRUITS UNDER GLASS.

By Jas. Whitton, *Gardener, Glamis Castle, Glamis, N.B.*

PEACHES AND NECTARINES.—Attend carefully and regularly to the early-started trees. Those on which the fruits are set and beginning to swell, will require careful and systematic disbudding, and thinning of fruits. The young and inexperienced cultivator frequently delays that operation too long. Thin early and often, is an old but true saying. If he have any doubt as to the proper method, a little practice and careful study of the matter will soon give him confidence. At the first disbudding, remove those growths which are placed at right angles to the plane of the trellis; at the second thinning, half of the buds on upper and lower sides of branch on plane of trellis should be removed, and at the third thinning, nearly all on the lower side of the branches, while at the final operation leave only those necessary to fill space and determined by system of training adopted. Generally on full-grown trees, the leading one to carry on the sap, and the best next on the upper side for next year's fruiting, will be ample, but no hard-and-fast rule can be given; the cultivator must exercise his judgment; but overcrowding of young shoots must be avoided, as on the proper development of the leaves all future success depends. In thinning the crop of firsts, first remove all small and badly-placed fruits. Endeavour to have all possible on the upper surface, where they will get the fullest amount of light, so that highly-coloured fruits may be obtained. Syringe the trees carefully in bright weather, and maintain a pleasant growing atmosphere. Temperature, 55° to 60° at night, and 10° more than this by day, with air. Succession-houses will now be advancing, and while it is a comparatively easy matter after this month to ensure a good set of fruit if the trees are in good order, still, the best may be ruined by carelessness, while those in an indifferent state may be saved by careful treatment, therefore, all trees that are in bloom will demand close attention. High night temperatures are, I consider, unnecessary and injurious, and productive of a variety of insect pests and other evils. A night temperature of 45° to 50° is ample till the fruits set. If the structures are light and airy, as are most modern houses, do not hesitate to give the trees, when in bloom, a light syringing with clean soft water early in the forenoon, and at 2 P.M. in bright weather. In old-fashioned heavily-timbered houses the case is different. Usually in these the atmosphere is more humid, and syringing would be injudicious, especially in the absence of sunshine, and trees in such structures should be kept somewhat drier; and to cause the pollen to fly or spread freely, adopt the usual modes of tapping the branches with the hand, or fertilising the blooms by a large camel-hair pencil, or other light article. Many cases of failure in the setting of stone fruits may be traced to the exhaustion of the trees when in bloom by a dry parched atmosphere, a state of the air which should be carefully avoided by judicious damping down and ventilating. Keep the late houses cool and airy, but not too dry at the roots, and afford the trees an occasional syringing; also damp the borders in dry weather.

FIGS.—Maintain a genial growing atmosphere in the early-house. A minimum of 65° at night will as yet suffice. As the growths come on, stop the shoots at the fifth or sixth leaf by simply squeezing the point in preference to breaking it off. Plants in pots must be carefully watered with water heated to 70°, and on no account allowed to get dry. As the fruits swell, give supplies of weak liquid manure water also warmed. Those houses from which midsummer and autumn supplies are obtained must be cleaned and dressed without delay. Where the crop is desired early in June and again in September, the plants should receive a thorough root watering, and be started with a night temperature of 50° to 55°. Syringe the trees twice a day, and frequently damp the paths, &c. Trees from which one crop annually is taken, usually in unheated houses, may be pruned and put in order, but the house need not be closed for some time yet.

CUCUMBERS.—During the frost, fruit did not set freely, but now that mild weather prevails, if a small amount of fire-heat be used, air may be afforded the house or pits early in the forenoon, by which means the pollen may become dry by midday, and the flowers fertilised before the ventilators are closed. More seed to provide plants for succession may be sown; and plants that are large enough for planting out should not be kept longer in pots than is necessary.

THE HARDY FRUIT GARDEN.

By T. Tubton, *Gardener, Maiden Erlegh, Reading.*

PLUM TREES ON WALLS.—These should immediately be pruned and trained, if this sort of work still remains to be done. Should the promise be for an abundance of bloom, it will be opportune to remove many of the longer spurs to within an inch or so of the stems, when, if the trees are healthy, young wood will show during the summer, much of which can be cut back to a few basal buds, thus forming new fruit spurs. Where crowded, the spurs should be cut away level with the branch. Plum-trees planted but a few years, which have made very strong shoots, should have them shortened back to about 2 feet from the point whence they sprang, selecting a well-placed bud to prune to. The overcrowding of the branches in these young trees should be avoided, no two branches being brought closer together than 6 inches, and wherever shoots were laid in excess of what was required during last summer, some of these should be cut back to two or three buds. All young trees growing strongly after being planted two years, should be lifted and replanted. Defer dressing the trees for the present, for the reasons given in the case of Sweet Cherries. The same kind of insecticide advised for those may also be used for the Plums. In soils deficient in lime, a dressing of mortar-rubble, chalk, or lime, should be afforded, as for the Cherry. As lime by its weight is always sinking deeper into the earth, it is better to afford slight annual dressings rather than heavy ones at long intervals of time, scratching it just under the surface, not digging it into the land deeply; in fact, the draw-hoe would be the proper tool with which to bury it.

ARREARS OF WORK.—Young vigorous Apple or Pear trees may still be root-pruned, and this is advisable rather than allow them remain until the autumn, and consequently have to wait a year longer. Where the trees are on free stocks, i.e., Apples on the Crab and Pears on Pear stocks, take out a sufficiently-wide trench that will enable the men to tunnel underneath the stems, where tap-roots may be expected. The cutting of these roots should be effected with discretion, and by men who have been accustomed to the work. In the case of trees on dwarfing stocks, as Apples on the Paradise and Pears on the Quince, less severe measures will be found sufficient to induce fruitfulness.

PRUNING GRAPE VINES.—The pruning of these should no longer be delayed, or the chances are, that where they are growing in warm soil on the south side of houses or other buildings, a short spell of mild weather may excite the sap, which would cause them to "bleed" when cut. Select suitably-placed eyes to make young rods, which should replace worn-out ones, and on the rods still to be retained, prune back the lateral shoots to one or two eyes.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

PLANTS, &c., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

LOCAL NEWS.—*Correspondents will greatly oblige by sending be the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

ILLUSTRATIONS.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY, FEB. 8—East Anglian Horticultural Club.
SATURDAY FEB. 12—Royal Botanic Society.

SALES.

MONDAY, FEB. 6 { Plants and Bulbs, at Protheroe & Morris' Rooms.
TUESDAY, FEB. 7 { Orchids, Azaleas, Camellias, Begonias, &c., at Protheroe & Morris' Rooms.
WEDNESDAY, FEB. 8 { Begonias, Gladioli, Pæonies, &c., at Protheroe & Morris' Rooms.
THURSDAY, FEB. 9 { Plants from Belgium, Carnations, Hardy Plants, &c., at Protheroe & Morris' Rooms.
FRIDAY, FEB. 10 { Important Sale of Hardy Border Plants and Bulbs, at Protheroe & Morris' Rooms. Orchids, from Messrs. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°.2.

London and the Provinces.

How often have we heard it said that provincial exhibitors have no chance against those in the immediate vicinity of the metropolis at the exhibitions of the Royal Horticultural Society! How often have we heard the Society described as a London Society, and nothing else! and yet we know that its objects are imperial—we may say cosmopolitan, and that the Society numbers among its adherents numerous Fellows in the colonies, especially in Australia, where the Society has found an excellent friend in the energetic Baron VON MUELLER. But reverting to the question of the allotment of Certificates to exhibitors from the home counties, and to those at a wider distance respectively, we may say that we have been lately provided with some statistics which will be read with interest. They show that the larger portion do fall to the share of the dwellers in the home counties; but until distance and time, to say nothing of railway rates, are abrogated, local proximity must, of necessity, continue to be an advantage to those who can avail themselves of it. As a matter of fact, the Royal Horticultural Society and its committees of experts, in estimating its merits, care nothing for the source whence an exhibit is derived. Even if one member did so, what would he be among so many? That mistakes of commission, and especially of omission, do sometimes occur is only to say that the jurors are human.

Here are the figures showing the distribution of the certificates during the year 1892; they tell their own tale:—

TABLE I.—GENERAL DISTRIBUTION.

Africa	1	France	6
America	1	Ireland	3
Belgium	10	Jersey	1
England and Wales	380	Scotland	2

TABLE II.—ENGLISH AND WELSH COUNTY DISTRIBUTION.

Bedfordshire ...	2	Lincolnshire ...	2
Berkshire	21	Middlesex	86
Buckinghamshire ...	10	Monmouth	15
Cambridgeshire ...	1	Norfolk	2
Derbyshire	2	Northamptonshire...	1
Devonshire ...	2	Northumberland ...	8
Dorsetshire ...	1	Nottinghamshire ...	6
Essex	9	Oxfordshire ...	1
Gloucestershire ...	17	Shropshire	1
Hampshire	5	Somersetshire ...	13
Herefordshire ...	1	Surrey	38
Hertfordshire ...	50	Warwickshire ...	1
Kent	49	Wiltshire	4
Lancashire	10	Worcestershire ...	2
Leicestershire ...	2	Yorkshire	7

We trust that these figures will induce our provincial friends to exhibit more freely than they do, in the full assurance that a really good thing is sure of recognition, be its source what it may. Provincial exhibitors, especially provincial gardeners, however, sometimes send up specimens which might perhaps pass muster at Little Peddlington, but which are not up to the London standard and are passed over accordingly. It is unfortunate in some measure, no doubt, but no one could recommend that the standard should be lowered. In our opinion, it should, on the contrary, be impartially maintained as high as it is possible. Country gardeners should take every possible opportunity of ascertaining what that standard is. We are ourselves able to gauge the lack of knowledge on the part of a certain proportion of gardeners by the specimens they sometimes send us of Chrysanthemums or Begonias, or what not, which the senders think very highly of, but which are much below the London standard—representing, indeed, a state of things that, perhaps, existed ten years ago. This arises, we believe, from the circumstance that the senders have not the opportunity they should have of visiting the local shows in their district; for we are well aware that certain things, Fuchsias for one instance, are better done in the provinces than we ever see them in London.

From one point of view the high standard which is evolved by force of circumstances at the Royal Horticultural Society's committees acts prejudicially on the gardener. The employers, and especially the employers' wives, visit the show, and they see and admire the Gloxinias of Messrs. So-and-So, or the Begonias of Messrs. This-and-That. Well they may, but too often it is to be feared they go home and marvel that their gardener is not able to produce flowers, or fruit, or vegetables equal to those on the exhibition table. This, of course, is grievously unfair to the gardener—as a moment's reflection would enable them to perceive. But it is no reason why the standard should be lowered.

Grumblers of an analogous type to that abovementioned are those who maintain that preference is shown at the Gardeners' Benevolent and at the Gardeners' Orphan Fund to applicants residing near London. Of course, the charge is preposterous. Those who make it have only to study the published records for themselves, but this they do not think of doing, and some, we fear, even base their refusal to subscribe their mite upon a fallacy of this kind, without ever giving themselves the trouble to make themselves acquainted with the facts of the case.

Fruit Selling and Growing.

IN some correspondence which has reached us we find, amongst other items of lesser moment, touching fruit, remarks on the smaller market prices obtained for excellent home-grown fruit as compared with American fruit. The writers seem to labour under the mistaken labour-economics of a past generation. To any cognisant, as we are, of what is shown and sold in the open markets of the metropolis, it is no secret that much of the success attending the importations of American Apples is due to colour in the fruit, irrespective of all other qualities which ought to weigh with the consumer, and to good sampling and packing.

Compare these fruits with the much juicier, heavier, and better-flavoured English fruit in baskets alongside in the wholesale shops, and in the eye of the usually uneducated buyer there are many points in favour of the American fruit, which therefore sells at the higher figure, to the neglect of the better home-grown produce. We may mention King of Tomkins County and Baldwin, the two, perhaps, which have the highest colour and are the commonest met with in the markets, although there are others almost as brilliant. Contemporaneously with the growers' efforts in making a better selection of varieties of Apples (and it is chiefly in this fruit that heavy competition is felt in our largest markets), as well as improved methods of culture, and of packing, the girls and boys might be taught whilst at school the names and appearance of our best varieties. It would be so easy to do this, and furnish the real thing to illustrate the lessons during the autumn and winter—there are scarcely a dozen; and at other seasons a few coloured figures would suffice. The children should be taught, too, that it is a patriotic virtue to consume a home-grown Apple, and that mere colour is not always a criterion of good quality even in our own varieties of Apples. Take, for instance, Autumn Calville, Hoary Morning, Marvellous, Lincolnshire Holland Pippin, and others, which are beautiful in appearance, but without good eating qualities. On the other hand, most of our early Apples, amongst culinary varieties, are deficient in bright colour, but it is not in this class of Apples that the foreigner competes to any great extent as yet.

We should like to know at what prices the American grower sells his fruit per barrel, and how much is garnered-in by the middleman — the man who takes some risks, certainly, but who has done nothing whatever in growing, sampling, packing or shipping it—and who buys it at an auction, and places it in his shop, and waits for the ignorant retail fruit dealer, who in his turn supplies the equally badly-informed housewife, servant-maid, and others.

The desired alteration in these things must begin at school, before we shall see British fruit-growing a real success. The County Councils everywhere seem to be doing much to educate the countryman, but they do not get at the town dweller, and he, after all, is a greater consumer of fruit from the foreigner, for is it not put in attractive guise under his nose and in quantity? And here the schoolmaster could become the best ally of the fruit grower if he were to supplement precept by example. There is a certain fallacy preached about the saving of labour brought about by the home grower planting only early varieties, but that is really giving away ourselves for no adequate reward, for what reason should we not grow the late varieties? Are we, forsooth, to leave the

Corridor at Messrs. Sander & Co.'s Nursery, St. Albans.

American an open field for his enterprise after the winter season begins, because by so doing we can do without labour? That is, we can make the poor man's earnings smaller, and they are still small enough, by withholding from him and his, work that he and they can well do — the gathering-in, storing, examining in store, and other jobs connected with the Apple-room during the winter. It is, in our opinion, a mistaken policy to pursue, and one that has opened our gates to the foreigner, has not cheapened fruit to the consumer, but it has led to an increase of the poor's rate and other evils in country parishes. It now looks as if in some parts of the country, notably where small holdings are not rare, as in Cambridgeshire, Lincolnshire, and Notts, the cottagers and the smaller holders would take up the culture of fruit, and it is to be hoped that these persons will be shown by the lecturers of the County Council, the advantages to be derived from growing well the finer, late-keeping Apples, not forgetting those which have an inviting appearance, albeit that is nearly always sacrificed when the fruit is eaten.

RAILWAY RATES.—A copy of the following letter has been communicated to us by the London Agricultural Seed Trade Association, 6, Market Buildings, Mark Lane, London, E.C. To the Right Honourable A. J. MUNDELLA, M.P., President of the Board of Trade. "Sir,—I am instructed by my Directors to call your earnest attention to the recent great advance made by the railway companies in their rates for the carriage of all articles brought from, and carried into, the farms of this country, an advance which cannot fail to have the most injurious effect on an industry, already in a deplorable condition. Railway rates in this country, compared with those ruling abroad, have always been excessive, and have been most detrimental to the interests of producers, handicapping them unfairly in their struggle with foreign competitors. Great hopes were founded on the recent Royal Commission on the subject, it being confidently expected that, not only would the companies be compelled to adopt a more reasonable scale of charges at home, but that the crying grievance of foreign produce being carried at much lower rates than home-grown, would be abolished. Both these expectations have been bitterly disappointed, and the present state of things is much worse than the last. Home rates, speaking roughly, have been raised from 20 to 60 per cent., while through-rates for foreign produce are substantially unaltered. Moreover, in addition to the great rise in carriage rates on home-grown produce, terminal charges have been imposed or incurred, acting practically as an increase of carriage. For instance, loading charges have been put on, and warehouse rent at the termini has, in many cases, been doubled. It will be found, too, in many cases, that the rates, &c., from competing stations are higher than those from which there is only one line; each company excusing itself for charges which it admits to be excessive, on the ground that it is fettered by its agreement with its competitors. So far then from the public benefiting, as they fondly suppose by the existence of rival lines, by allowing the companies to band themselves together to support rates, they actually suffer from the existence of competition! In brief, every device has apparently been resorted to, to extort from the commerce of the country the uttermost farthing, oblivious of the fact that excessive charges, by killing traffic, are as injurious to the railways themselves as harmful to the interests of the nation. As an illustration of the excessive charges which agriculture in this country has to submit to, it may be mentioned that it costs less to bring agricultural seeds from Chicago to London, a distance of about 4000 miles (of which 1000 are by rail and 3000 by steamer, than it does from stations within 150 miles of London. In Europe also, the difference though less is still excessive, the carriage from the North of France to London being less than from the home counties, and from the South of France than from Yorkshire! It appears to this Association, that when the monopoly of transport in a certain district has been handed over to a railway company, it is the duty of Government to see that the Company exercises its powers in a reasonable way, that it carries passengers and goods at charges in fair proportion to the work done, and that short-sighted or ignorant railway boards shall not be suffered to injure their own traffic, and kill the commerce of the country by undue rates. I am instructed, then, by my directors, to express a hope that the Board of Trade will exercise their powers to compel the railway companies to desist from a course, suicidal to their own interests, and disastrous to the country at large, and if the present powers of the Board are found insufficient to bring the companies to reason, application may be made to Parliament to enlarge them.—I have the honour to be your obedient servant (Signed), DAVID ALLESTER, Secretary. Chairman: John Picard. Vice-Chairman: Wm. Neustelet. Directors: Thomas Barker, James S. Easter, Bernard Henderson, Wm. J. Nutting, Nathaniel Sherwood, David Syme, Thomas Thornton, Jun."

—— A meeting of delegates from 128 Chambers of Commerce and other bodies, of traders and agriculturists from all parts of the United Kingdom, in connection with the Mansion House Association on Railway and Canal Traffic, was held on Monday afternoon at the Mansion House, to protest against the action of the railway companies with reference to the recent raising of rates. A large number of Members of Parliament was present. Sir JAMES WHITEHEAD, M.P., moved the first resolution, to the effect, that in the opinion of the meeting, in view of the persistent efforts made by the railway companies for many years to secure additional powers of charge, the large and general increase in rates which they had recently made had shown conclusively that the fixing of actual rates should not be left to their irresponsible discretion. This, he said, expressed a want of confidence in the railway companies. Mr. JAMES LOWTHER, M.P., seconded the resolution, and in so doing pointed out that on this occasion town and country were united in their efforts to obtain justice at the hands of Parliament. He was in favour of appointing a tribunal, or the extension of the powers of some existing tribunal, to protect the trade of the country. If rightly used, he contended that they had in their hands the power to compel the railway companies to accede to their just demands. Mr. CHANNING, M.P., and others supported the resolution, which was unanimously carried. Mr. W. S. CAINE, M.P., the Marquis of HUNTLY, Mr. C. M'LAREN, M.P., and others supported subsequent resolutions, which were also passed in favour of extending the powers of the Board of Trade, and pledging those present to support the Mansion House Association in its efforts.

LONDON COUNTY COUNCIL.—Mr. G. GENSEL, assistant in the Frame Ground, Kensington Gardens and Hyde Park, has been selected from a number of competitors to fill the post of Landscape Draughtsman in the Parks Department of the London County Council.

ROYAL MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.—The report of the Council submitted to the annual meeting of proprietors on Monday last, states that in consequence of the arrangements made with the committee of "Old America, Limited," several fixtures set forth in the last annual report had to be abandoned—notably, the annual national horticultural exhibition held for the last twenty-five years at Whitsuntide. The other floral and horticultural exhibitions were held. The promoters of the "Old America" Exhibition sustained a serious loss, and the Council have accepted £1000 less than the amount (£4250) agreed upon. Several items of expenditure connected with the fruit conference held in the autumn of 1891, are included in this year's financial statement, besides which a considerable amount has been expended upon the buildings. It will be seen by referring to the provisional arrangements for the year, that a new departure is recommended in connection with the Whitsuntide exhibition. It is suggested that this exhibition shall consist of two specialties—namely, Orchids and artistic groups. Another feature of considerable importance will be incorporated in the year's proceedings, namely, that of technical education in connection with horticulture. When the details are complete, the public will be made acquainted with them. Special exhibitions of bulbs, Auriculas, Roses, Chrysanthemums, Tulips, Carnations, Picotees, Pinks, &c., will also take place during the year.

Provisional arrangements for 1893:—Spring flower show at the Town Hall, March 14 and 15; sacred concert at the Gardens, on Good Friday; miscellaneous concert at the Gardens, on Easter Monday; spring flower show at the Town Hall, April 25; Whitsuntide Exhibition open at Gardens, May 19; Rose show at the Gardens, July 22; Chrysanthemum and hardy fruit show at the Town Hall, November 21 and 22. In addition to the above, exhibitions of the National Auricula, Tulip, Carnation, and Pink Societies, will be held. The time will, in each case, be duly announced. Technical horticultural education, Friday afternoons or evenings. Musical days, Wednesdays and Saturdays during the months of June, July, and August.

TORQUAY HORTICULTURAL SOCIETY.—The annual meeting of the above Society was held on Saturday, the 21st ult. Captain FANE TUCKER presided. The committee reported an adverse balance of £6 13*s.* 1*d.* They were glad to say, however, that it was less than last year, but this was entirely owing to an anonymous donation of £10. Subscriptions had again fallen off, but the entrance-money taken at the two shows exceeded that of 1891 by £33. There was an increase in the amounts paid for prizes at the two shows, but a less amount was given to the Rose show for prizes. Mr. WYNDHAM FITZHERBERT had consented to allow himself to be nominated as hon. secretary. The spring show was fixed for Thursday, March 23, and the Chrysanthemum show, Wednesday, November 8; and it was decided to give £15 towards the prizes at the Rose show at the Devon Rosery on June 27 and 28.

TRENT VALLEY COTTAGE GARDENING SOCIETY.—The show this year will be held on Bank Holiday, August 7, by the permission of the Earl of LICHFIELD, in Shugborough Park.

MONSTROSITY OF THE FLOWER OF THE CARROT.—In the *Bulletin Mensuel de la Société Linnéenne de Paris*, July 6, 1892, M. HEIM records the existence of a monstrosity in Daucus Carota, in which two leaves spring from the base of the receptacular tube, the leaves representing the carpellary leaves. M. HEIM is under the impression that this monstrosity has not been described in teratological books, even those most recently published. A reference to *Vegetable Teratology*, p. 261, shows that the change in Daucus is specially frequent, the * denoting frequency being prefixed to the name. A long list of references to similar malformations is given in PENZIG's *Pflanzen Teratologie*, and a figure of a similar state of things is figured in the *Transactions of the Linnean Society*, vol. xxiii., p. 490, tab. liv., fig. 4, and in Dr. DAMMER's German edition of Dr. MASTERS' *Teratology*, p. 300, and *Journal of Botany* (1875), p. 79.

THE JARDIN DES PLANTES, PARIS.—From a pamphlet before us, it appears that a disaster was imminent a few weeks since, when with the thermometer each night at —7° C. or —8° C. (= 17° to 19° F.), there were not two "paniers" of coal left, and this in spite of frequent "reclamations" and warnings on the part of the "Professeur de Culture," who on one occasion had to order a supply of coal at his own cost.

It appears, moreover, that the heating apparatus is altogether defective, and requires re-arranging under the direction of a competent hot-water engineer. It is only reasonable that the director of a great botanic garden, and responsible for its due maintenance, should be allowed his discretion and freedom of action untrammelled.

CHISLEHURST GARDENERS' ASSOCIATION.—At a large and overflowing meeting held by this association on the 24th ult., Mr. CANNELL, of Swanley, gave a lecture on the Rose, and many were the points of interest alluded to by such an authority, which called forth hearty applause from those assembled. Although the society is only in its second session, it is already recognised as forming a means by which much useful information has been obtained, and Mr. CANNELL'S visit had been looked forward to with great interest.

CRINUM PEDUNCULATUM.—Baron Sir FERDINAND VON MUELLER sends us the following interesting communication:—"I visited an island ten miles up the river, the centre of which was very swampy; in fact, we camped there for three weeks. This swamp contained hundreds of plants of Crinum pedunculatum, which are just now in full flower, and a more magnificent sight I have never seen. The plants I saw on the Richmond River a few months since are mere infants compared with these. I measured one plant, and as it may be of interest, I give the details, viz.:—Circumference of stem, 2 feet 5 inches; height from root to leaf-tip, 7 feet 11 inches; height from root to flower-head, 8 feet 2 inches; circumference of flower-head, 2 feet 10 inches. The weight of plant when dug up and soil washed from the roots must be 30 lb. to 35 lb. Each plant gives three to five flower-stalks. The flower is a pure white wax, and gives a delicate perfume. To my mind, this is the most beautiful bulbous plant in Australia. I had no means of bringing any of these very large specimens away, but when again in that district (in two or three months) I will send you a few. Some months since I sent a few of these bulbs to England. They carried in first-rate condition, but could not be sold; I suppose, because they are unknown. CH. CRESSWELL, *Sydney*."

ROYAL COLLEGE OF SURGEONS OF ENGLAND—The following is the syllabus of three lectures on the "Action of Fungi on the Human Body," to be delivered in the theatre of the College on Monday, Wednesday, and Friday, February 6, 8, and 10, at 5 o'clock each day, by Professor CHARLES BAGGE PLOWRIGHT, M.D., M.R.C.S.:—

Lecture I.: Monday, February 6.—"Fungi as Food-stuffs."—Introductory remarks; Morphology and biology; Hymenomycetes; Elvellacei; Classical allusions to fungus-eating; Discrimination of edible from poisonous kinds; Methods of preparation and cooking; Chemical composition—cellulose, albuminoids, fats, sugars, mannite, trehalose; the common Mushroom and its varieties.

Lecture II.: Wednesday, February 8.—"Fungi as Poisons."—Agaricus Phalloides and its allies; Botanical characters; Cases of poisoning by; Symptoms; Chemical composition; Kobert's investigations; Phallin; Agaricus muscarius; Cases; Action of Muscarin; "Pilzatropin;" The Lactarii; Helvella esculenta; Helvellic acid; Other species.

Lecture III.: Friday, February 10.—"Edible and Poisonous Fungi."—Brief descriptions, actions, and uses of the more important dietetic, toxic, and therapeutic species, with illustrations.

SALARY OF ESTATE MANAGER.—The necessity for raising the professional standard of gardeners, and others fulfilling responsible positions in connection with horticulture and allied branches of industry, is evidenced by a letter before us, in which the advertiser offers the sum of £65 a year, with house, garden, and haulage of coal. For this sum the fortunate competitor is to manage "a small estate of 1600 acres, superintend everything, gardens, land in hand, farms let, buildings, keepers, woods, planting, &c., pay all wages, keep all accounts, and receive and account for all rents under ten pounds a year. A skilled head gardener is kept, but he, and all my men, would be under the manager." We wonder what the salary of the skilled head gardener is, under such circumstances. Such low rates of wages, though they cannot justify, extenuate the receipt of commissions, tend towards dishonesty, and prevent capable men from attaining the position to which their experience and capabilities entitle them.

TASMANIAN FRUIT EXPORTS.—Growers of fruit in this colony are at present apprehensive about the success of the oncoming Apple crop, owing to unfavourable weather, and the probable value of the fruit when placed on the London market—if it should be ample enough to justify a large shipment. New orchards it is supposed will make up for failures through unfavourable meteorological conditions, and greater care in picking, choice, and packing will this season be looked to, last year's experience on these lines having been costly—not everything will do for the English market, it is found. Should the Australian crops prove short, of which there is some prospect, then a local demand will be experienced, and shipments for England be restricted—but a short time will settle these matters. It would appear that much more attention is being paid to the cultivation of sorts best suited to the English market, and altogether, recent bad fortune would appear to have been looked at in the proper light.

CROTOLARIA JUNCEA.—This plant has for some time been placed on its trial in several parts of Natal, with a view to competing in the English market, but up to the present time results have not been sufficiently favourable to justify carrying on the experiment.

THE TRANSVAAL AND FRUIT IMPORTS.—The reports from the upper districts of Natal are to the effect that large crops of Apples, Pears, Plums, &c., have been gathered, which would have been sent to the Transvaal, but for the prohibitive duty of 15*s.* per 100 lb. load on fruit. This also affects the fruit grown at the Cape; and thus producers in both colonies are severely hit by this heavy and surely injudicious duty.

THE SURVEYORS' INSTITUTE.—The next ordinary general meeting will be held on Monday, February 6, 1893, when the adjourned discussion will be resumed on the papers read at the meeting on January 9.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—It is with great pleasure we make the announcement that Baron SCHRODER has undertaken to preside at the Fifty-fourth Anniversary Festival Dinner at the Hôtel Métropole on June 22 next, in aid of the funds of the Gardeners' Royal Benevolent Institution. We trust that this popular patron of horticulture will be generously aided in his efforts on behalf of this useful Institution.

METROPOLITAN PUBLIC GARDENS ASSOCIATION.—The tenth annual report shows what valuable work has been done during the last ten years by this society. In this period, speaking broadly, eighty-two grounds have been opened under the society's auspices, 116 play-grounds for children thrown open, 2240 trees planted in fifty-one different metropolitan districts, 1000 seats supplied, eighteen fountains erected. Six and a half acres at Bethnal Green have been saved from the builders, and no fewer than 345 acres at Hackney. The income of this valuable society, we regret to see, has fallen off, but the publication and circulation of this report ought surely to secure a large additional body of subscribers.

PRIZE-FIGHTING AND GARDENING!—Gardeners are addicted to contending for prizes, but they are certainly as a class, not given to prize-fighting. There is no accounting for individual aberrations, and so we find the National United Order of Free Gardeners in assembly at Higham Ferrers, passing a resolution on the proposition of the Moss Rose Lodge, that in the case of the death of any member in consequence of a prize-fight, no funeral allowance be paid to his representatives. It appeared that a member of the "Fuchsia Lodge" was killed under such circumstances. The meeting adopted the resolution by a large majority, so that free-gardeners before engaging in prize-fights must remember that their funeral expenses may not be provided for. The "lodges" of this Society take their names after Snowdrops, Roses, Sunflowers, White Lily, Vine-leaf, Shamrock, Thistle, Primrose, Lily of the Valley, Blue Violet, and other flowers. Clearly, prize-fighting is out of place in such meetings, though a little diversion might be acceptable, for the meeting to which we refer lasted, according to the *Oundle Gazette*, for upwards of seven hours. We strongly suspect that the "Free Gardeners" are gardeners in name only.

SHAMROCK.—According to the *Irish Naturalist*, Mr. COLGAN has collected from eleven of the Irish counties thirteen specimens vouched for by the natives as being the true Shamrock. The specimens were duly labelled and cultivated till they flowered, when of the thirteen eight were determined to be Trifolium minus, and the remainder T. repens, What is generally sold in London is T. repens, but we have seen the leaves of Oxalis Acetosella designated as Shamrock.

FASHION IN FLOWERS.—A correspondent of the *Garden* points out that ten years ago forty-seven Pelargoniums were certificated and six Chrysanthemums. In 1892, however, twenty-four Chrysanthemums were certificated at the Royal Horticultural Society, and only seven Pelargoniums. Does not this show that special societies are powerless to avert the changes of fashion?

TECHNICAL EDUCATION.—On the 19th ult. evening, Mr. R. COCK, County Council lecturer on cottage gardening, gave an interesting lecture in the schoolroom at Sandon (Staffs.). Mr. COCK spoke first on bees and bee-keeping, illustrating his remarks with magic-lantern views. He strongly recommended cottagers to try bee-keeping as a profitable business. He afterwards dealt with winter work in the garden, discussing insect-pests among other things, and recommending fruit-growing, which, with care, could be made to pay well.

SEMI-DOUBLE FLOWERS OF REINWARDTIA TETRAGYNA.—Among the many items which render the Show-house at Kew gay at the present time, the two species of Reinwardtia are by no means the least conspicuous. They are better known in gardens as Linum tetragynum and L. trigynum respectively, but differ in some minute technical points from Linum. Their clear yellow circular plate-like flowers, which are produced in profusion, render them desirable inmates of the greenhouse at this season. The method of propagation and cultivation prescribed in NICHOLSON'S *Dictionary*, is to take cuttings from the strongest points of old plants in spring, and place them in the propagating-frame. When rooted, they may be grown on in an intermediate temperate until established in 5 or 6-inch pots. A compact habit should be induced by frequent pinching. In autumn the plants should be exposed as much as possible to sun and air in order to ripen the wood, and promote flowering in the winter. The old plants may be preserved, but it is more satisfactory to grow them from cuttings every year. The species are natives of hilly regions in North-West India, Sikkim, Assam, and Chittagon, southward to the Nilghiri hills. R. tetragyna has larger lanceolate leaves, R. trigyna has broader, more obovate leaves, but the two are probably only forms of one species. Many of the flowers we observed lately had the innermost sepal of a yellow colour, like the petals, thus offering an instance of petalody of the sepals.

SNOWDROPS.—No sooner has the frost gone, than we begin to look out for the Snowdrops.

According to Roberts' *Naturalist's Diary*, the average earliest first appearance is on January 11, the latest average first appearance, on the forty-seventh day of the year, e.g., February 16. In some tables published in the *Gardeners' Chronicle*, April 7, 1888, the earliest flowering of the Snowdrop is given as December 24, 1778, the latest February 10, 1795, a difference of forty-eight days as observed at Stratton, Norfolk, during a period of fifty-five years. At Cobham, Surrey, according to Miss Ormerod's reductions of Miss Molesworth's observations, the mean earliest date, out of twenty annual observations in the same place was, the thirty-third day of the year, i.e., February 2, the earliest, January 10, the latest on the fifty-sixth day of the year, viz., February 25. The earliest date of which we have any record (we omit, of course, the October-flowering variety), is December 22, 1890, at Greenock. In our own garden, in Middlesex, the subsoil of which is cold clay, the dates for the last four years are as follows: —1890, January 9; 1891, February 6; 1892, January 22; 1893, January 30.

Fruit Cultivation in England, and Imported Fruit.—The following interesting statement as to the cultivation of fruit in England was made by Mr. H. R. Williams (the acting Master) at the dinner of the Fruiterers' Company lately:—"The following was the area under small fruit cultivation in England and Wales in each of the following years: —1888, 36,700 acres; 1890, 46,200 acres; 1891, 58,700 acres. Compared with 1888, there is an increase in 1891 of no fewer than 22,000 acres. Of this increase, 1760 acres were added to the small fruit area in Kent, the area for that county for the year 1890 being 10,061 acres, and for 1891, 19,821 acres. From these figures it will be seen that Kent maintains its pre-eminence in fruit-growing. Orchards also show a gradual and not inconsiderable increase in area. In 1881 the returns show 185,000 acres, while in 1891 the total was 210,000 acres, an increase in ten years of 25,000 acres. Market gardens also show a considerable advance in area. In 1881 there were under cultivation 46,604 acres, while in 1891 there were 81,368 acres, an increase in ten years of 34,764 acres. In 1882 the raw fruit imported, exclusive of Oranges and Lemons, amounted to 5,000,861 bushels, while the quantity in 1892 was 7,387,670 bushels. The Oranges and Lemons imported in 1890 represented a quantity of 5,746,135 bushels of the value of £1,756,852, while in 1892 the imports came to 6,763,276 bushels, of the value of £2,052,561. *City Press.*

Beckenham Horticultural Society.—The annual meeting of this society was held on Friday, January 27, at the Public Hall, the Rev. Chas. Green, in the absence of the president, in the chair. Although only started in April last, the society has made great progress. From the report it is seen summer and autumn shows were held, and during the autumn a course of lectures has been given by Professor Cheshire. The total income for the nine months was £271, and although encountering bad weather for the autumn show, there is a substantial balance in hand. There are 200 members, and 300 subscribers. The society promises to become very important. The members of the above paid a tribute of respect to the memory of Mr. Alfred Thornton, who was buried at Beckenham on Saturday last, by sending a magnificent wreath of Orchids, &c. The deceased gentleman took an active part in the secretarial duties of the society, and among the mourners, Mr. Cooper, the chairman of the committee, attended, as representing the society.

Foreign Fruit.—Sir William Hart Dyke has given notice that he intends to introduce a bill into the House of Commons for the better regulation of the sale of foreign and colonial fruits.

Brixton, Streatham, and Clapham Horticultural Society.—At the annual general meeting of this Society, held recently, the date of the autumn show was fixed for November 8 and 9. The show will be held at the Town Hall, Streatham, and on the suggestion of the Honorary Secretary, Mr. W. Roupell, it was resolved to affiliate the Society with the Royal Horticultural Society.

Nursery Notes.

MESSRS. SANDER & CO., ST. ALBANS.

[*See Supplementary Illustration.*]

Our supplement represents a corridor at the entrance to the various parts of these extensive and admirably-constructed premises. Its position is such that the visitor passes into it from the entrance hall. The aim has evidently been to represent a rockery or dell, cut out of the solid rock, and in this the builder has been successful to a large degree.

The pockets are made as natural as the circumstances would allow, and the efforts to produce an effect similar to that wrought by the ravages of weather and time upon stone, show judgment and skill of the first order, particularly that immediately opposite the entrance. The house is kept at an intermediate temperature, and it is therefore an easy matter for Messrs. Sander to furnish it with suitable plants; whilst the Orchids, which are planted in the various pockets, lend an uncommon appearance to a structure of this description. In many places the stone is almost hidden beneath the fronds of the different Ferns, the leaves of Begonias, Aspidistras, Cyperus, Echeverias, Pitcairnias, &c., but in others again the leafage is not so dense, and here many Orchids are planted, which thrive admirably, and cling to the rock with wonderful pertinacity, particularly Angræcum Sanderianum, whose roots were wandering over and about the stone in every direction. Some of the Cymbidiums are here in clumps, especially C. Lowii, which is quite happy in the pockets, and from which there are many spikes of bloom now ascending. Although only part of the corridor is represented in the figure, another, and more narrow, wing proceeds along from the left of the centre, and leads into the large house into which all the other houses on this side open, and which includes the new plant department. The rockery in this corridor, to the left, is formed on a comparatively straight wall, and the conditions have not been such as to permit of the same thoroughness that we see in that on the other side. The pockets are small, and for the most part filled with Cypripediums in variety, which, when in bloom, would no doubt be attractive; for we noticed that C. caudatum had been planted near the top, so that its long petals are able to hang down and show themselves in a natural manner. At the extreme end, in the other direction, is placed a mammoth tub of Sobralia macrantha var. nana; and here the door opens into a very long corridor, into which all the opens into a very long corridor, into which all the remaining houses open, and which also leads to the extensive buildings in which is produced the *Reichenbachia.* Hence, when the visitor has once made his *entrée* to the establishment, the whole of the houses are open to his inspection, without any further acquaintance with the outer air.

But the photograph from which our supplement is taken does not represent the corridor in its normal appearance, nor as it is described in the foregoing remarks, inasmuch as it was taken but a few days before one of the large exhibitions of last year, at which Messrs. Sander were successful in obtaining many certificates and other awards for rare and valuable plants. These specialties had been brought from their usual places, and were grouped together in this house as a kind of preparation, which should the better enable them to withstand the dangers inseparable from travelling to and from London. The only stage upon which these are collected can easily be seen in the photograph, and is arranged over a kind of basin, containing water which has trickled from the highest point of the artificial rock. These new plants, as we have before remarked, are not in this place except on such occasions, and now the stage and everything connected therewith is removed. At the present time they are in their several quarters, and as most of them were noticed and described in our issue for June 4, 1892, when reporting the International Show at Earl's Court, we may be excused from again describing them at this time. In addition to these, however, we noticed a new Kentia, called K. Bohnhofiana, which appears quite distinct from the rest of the species, the leaflets of which are nearly erect instead of drooping, and which may prove a very useful plant. The only known plant of the new Selaginella Moorei is looking well, and there are several other new species of plants here of which it would be premature to speak at present except in the most general terms. All the Orchids are looking in their usual healthy condition, and we think that this is attributable in no small measure to the size and character of the houses, which present so striking a contrast to the inconveniently little places so many growers have at command. It is seldom that the houses are entirely closed, for Mr. Godseff is a veritable enthusiast in his belief in abundance of fresh air. There are many hybrids of most species of Orchids near upon blooming, and, indeed, a good number are carrying flowers at this date.

From a cross between Dendrobium Wardianum and D. Dominianum× (the latter being the seed-bearing parent) we noticed several very pretty forms, in which both the parents are distinctly traceable. D. Wardianum in the flower, and D. Dominianum× in the less deciduous character of the hybrids. They will be known as D. Owenianum×. One of these flowers is finely marked on the lip with deep maroon, and fringed with pale lemon; a pretty hybrid. A hybrid Phaius, from P. tuberculosus, and P. grandifolius, is in spike, and if sufficiently forward will be shown at the next meeting of the Royal Horticultural Society. The new Cypripedium exul×, figured in our issue for April 23rd, 1892, is in bloom, and some fine spikes of the beautiful Lælia anceps Stella, also the little-seen L. Lindleyana. Huge batches of healthy plants of Cattleya Trianæ, C. Schroderiana, and C. Percivaliana, are throwing up innumerable sheaths, but some plants of Oncidium ampliatum majus surpassed all for their wonderfully strong spikes, which were as thick as the finest Asparagus. A new little Cattleya—a cross between C. dolosa and C. Trianæ Dayana, has produced a violet bloom with intensely coloured lip. This is the first bloom, and there are stronger plants yet to disclose their worth, it will therefore be wise to wait a little longer before passing judgment upon this, as upon many others here. Odontoglossums are in bloom in good variety, and close to these are some flowers of Lycaste Skinneri alba, and two pretty hybrid Masdevallias. Planted at the end of one of the houses is a monster specimen of Grammatophyllum Sanderianum, which was imported during the autumn of last year, and possesses many pseudobulbs, 7 or 8 feet high, and 3 inches in diameter. Really, a very curious object it makes, and it is said that it may find its way to Chicago during the present year. A fine importation of Lælia purpurata has arrived in splendid condition, and also small consignments of other species. The Cœlogynes, Cypripediums, &c., are looking first-rate, whilst, as we were leaving, we noticed some good pieces of Cattleya citrina, not in flower, of course, but in perfect health. The above does not enumerate by any means all the objects of interest at St. Albans, but our object was not a general review, and we must refrain from writing further.

FLORISTS' FLOWERS.

CHRYSANTHEMUMS.

If all has gone well with the cuttings of the above, the first batch will be rooted, and occupying a shelf close to the glass in the greenhouse, where they will be gaining strength and laying the foundation of good blooms in the future. Sufficient space should be allowed them, that the leaves of one potful do not touch those next to it. Water should be afforded when the soil approaches dryness. It is not prudent at this season to afford the plants, in a cool house, water at a low temperature, neither should very much water be supplied them. Many examples of paleness in the foliage may be traced to one of these two causes, as anyone may test for himself, by allowing a sickly-coloured plant to remain on the dry side for a fortnight or thereabouts, when a change will take place in the green tints. Tepid water then is best for the plants at this early part of their growth, as cold water checks rooting and gives the pale colour to the foliage. When the cutting-pots are filled by the roots, the cuttings are fit for their first shift into larger ones; for should the roots become matted together before repotting, future growth will be stunted, and the lower leaves will fall prematurely and when least expected, as it is not directly after root-action is checked that the leaves show signs of it.

It is necessary to determine at this time the size of pots the plants are to flower in, because upon this will depend the size of pots employed for the intermediate shifts.

For the bulk of the varieties, a 9-inch pot is sufficiently large, and the first shift should be into pots of 3½ inches in diameter, and the next one into pots of 5½ inches, and from those into 9-inch pots. If growers desire to use larger pots, say, of 10 inches in diameter, 4½-inch pots should be used at the first shift, 6½-inch at the next, and, finally, 10-inch pots. Where pots 10½ and 11 inches are in stock, I prefer placing two plants in each in preference to using them for single plants, and using the weaker-growing varieties. By this means a great saving of space is effected, as nearly twice the number of plants may be grown in the same space. To prepare the plants for these pots, at the first shift they should go into the 3½-inch size, and then into the 5½-inch size, which allows them to be of the right size to occupy the 11-inch at the final shift. As the "cast" sizes vary at different potteries, I think it better to give the size in inches, always taking inside measurement. At the first potting, the soil should be well prepared, much depending upon the progress made at this stage. Some cultivators are apt to think because the pots are small, any kind of compost will serve. I once made the same mistake with a batch of plants; for not having fresh soil at command, and not thinking it necessary to wait a few days, I utilised the soil from the pots in which the plants grew the year previously. As this was fibrous, and had received much manure, I concluded it would answer the purpose if I added to it some fresh leaf-mould. But the plants grew very little, and what growth there was only puny, and although the plants were shaken out of the stuff and put into fresh soil, they never thickened at the base as they should have done, and remained nearly as they were the whole year—a failure. The soil for this first potting should, then, consist of two parts fibry loam, one part leaf-soil, and one part spent Mushroom-bed dung, and plenty of sharp silver-sand. If the loam is inclined to be heavy, add crushed charcoal or wood-ashes freely.

For greater convenience in potting, pass the compost through a coarse sieve, rubbing the fibrous parts through it. The pots must be quite clean, and carefully drained, and over the crocks place some of the rougher parts of the soil. Pot firmly. If the soil is moist when used, as it should be, no water will be required for a day or two, after which time they must not be allowed to suffer by want of it; neither must they have too much. Return them to the greenhouse shelf till the roots run through the soil to the sides of the pots.

For a few days after potting, rather less air should be afforded the plants, but when once new roots begin to form, they should have abundance of air. Soon afterwards place a neat stake to each, and transfer them to a cold frame or pit; standing them upon a thick bed of coal-ashes near to the glass. Keep the lights rather close for a day or two, avoiding draughts by tilting the light a little on the opposite side to that from which the wind blows, after which admit abundance of air according to the state of the weather. A convenient spot should be selected for the frame, where it will be sheltered from the east wind, and receive the full day's sun. On some very fine days take the lights off for a time, as by this means the plants are kept "stocky." When the plants are growing freely, they will require abundance of water at the roots, but if too much should be afforded them, being in a low temperature, they will soon suffer in consequence. Green-fly is often troublesome to the points of the shoots, and if neglected, the tender leaves quickly curl up, and thus growth is badly checked. A dusting of the infested points with tobacco-powder will soon put an end to these troublesome insects, applying the powder at night, syringing the plants the next day to cleanse them from both powder and fly.

CHRYSANTHEMUMS ON WALLS.

I do not think nearly enough pains are taken to make use of the means at hand to produce a show of blooms during the month of November, in addition to the regular display in the greenhouse. Very few people seem to realise what a quantity of blooms can be had from plants growing at the base of a south wall, or even from an east wall, with no protection beyond that afforded by the wall itself. By following out a few simple cultural instructions, much of that which would otherwise be bare walls may be rendered gay with blossoms throughout November and part of December. The main point is to grow suitable varieties. Last November, we had a capital display from plants against a south wall, which is 7 feet high. It was, indeed, pleasant to turn from the giants inside, and which were then on the wane, to the smaller but brighter-coloured blooms on the wall.

Where means do not admit of a batch of plants to be grown for late-flowering inside, the wall plants will give flowers in profusion after the ordinary varieties are cut down. If there could be a wide coping temporarily fixed to the wall, and to this some light form of shading arranged, so that the plants could be protected in the case of hard frost, bloom might be prolonged for a much longer period. The reflexed sorts are best adapted for walls, the water not lodging readily amongst the florets. Next in order of merit come the reflexed Japanese varieties and the Pompons, the latter making a good show. Single varieties are also suitable, as these bloom freely, and last in good condition for a long time.

The varieties which were in flower at the time mentioned were golden and pink Christine, Mrs. Forsyth, Progne, and Mrs. Horril of the reflexed section. Of the latter nothing but praise can be said. Strange to say, it is a reflexed sport from George Glenny, the parent being an incurved, which is a rather unusual freak. One plant of Mrs. Horril was 7 feet high, and covers a wall space of 6 feet across, and the flowers being borne on long spikes, it is a striking object, and it is one of the best for a wall. Of Pompons, Sœur Mélanie is very good, the growth free, and bloom abundant. Golden Circle bears a profusion of yellow blooms. President, a purple flower, is one of the most showy in this section. Golden and Madame Martha, the latter white, are both worthy of a place; so are Nelly Rainford, amber; Cendrillon, rose-lilac; Mrs. Bateman, orange-brown; Pygmalion, deep rose; Prince Victor, dark maroon; and Snowdrop, white, are the chief Pompons. Of Pompon Anemones, Dick Turpin, magenta-crimson with yellow disc, is showy; also Antonius, yellow. The Japanese section was represented by Sunflower, very fre covering a space 6 feet high by 5 feet; Etoil de Lyon is a capital variety for outdoor cul ture; L. Canning, white, is very late; Maiden Blush is most proliferous; Annie Cibran gives pale shade of pink. Val d'Andorre is really mor profuse here than when growing under glass, an M. Bernard is certainly richer in colour; both thes deserve to be planted out largely. Sarah Owen, bronze yellow; Mme. J. M. Pigney, white. E. Molyneu provides bright colour; this is really first-rate fo the purpose of producing flowers in abundance individually, the blooms are inclined to be single And lastly, Lady Selborne, which is excelled b none; the flowers are produced in clusters of th purest white. Sœur Dorothée Souillé is very pro ductive of flowers, and when allowed all freedom t bloom, the blooms, if small, show well the silver tint, which affords variety.

A very few remarks of a cultural characte will suffice. The best plants are those which hav flowered in pots, on account of the numerous shoot that spring from the base of each; these seem bette to cover the lower part of the wall than youn plants. Remove the bulk of the soil from the roots If the staple is poor, add some fresh loam or manur at planting time. Afford the roots copious supplie of water in dry summer weather, and syringe th plants on fine evenings, which will check mildew and keep them clean. A mulching of horse dung about the roots would be of use, and rende watering less frequent. One of the principa points to observe is, that crowding of the shoot should not be allowed; therefore, cut away at th base the weak shoots, and those that cannot well b laid in. *E. Molyneux.*

ROUND MANCHESTER.

(*Continued from p. 99.*)

The Royal Botanical Gardens.—A visit t the bright and pleasant gardens at Old Trafford found its clever Curator, Mr. Bruce Findlay steadily directing operations with a view to effacin the traces of the "Old America" Exhibition, an the uncongenial class of visitors such a show must bring in its train. It must have been a sa experience to witness the daily more visible trace of that modern dissipation—a popular exhibition, o the grounds so recently and so beautifully remodelled but it having been got over, the few thousands whic accrue to the treasury, will be useful in preparin other exhibitions and doing other work more i keeping with the dignity of a Royal Botanics Gardens, and in arranging which Mr. Findlay is on of the most successful men of the day.

If the gardens had suffered much from the visitor the collections under glass had been so carefull guarded that but little mischief had been done, an we found all the houses gay with flowers.

The Grand Avenue, as the main exhibition build ing is called, is being re-arranged for the monste Orchid show on Fridsy, May 19, when the groups i competition will be arranged in it, while the variou other classes specified in the schedule will be stage in the large exhibition hall beside the main building and on the higher level. Mr. Findlay means to d his best to have the finest Orchid show ever seen and if growers respond in large numbers, as h anticipates they will do, a grand exhibition will result

A walk through the houses disclosed some prett groups of winter flowers arranged with foliage plants In one of the Orchid-houses a very effective settin of Cypripedium insigne, with Calanthes, Ferns, an coloured foliages was observed; in another in th centre a very finely-flowered specimen of Cypripe dium Haynaldianum, and around it bright-coloure specimens of Cattleya labiata, Cœlogynes, the blue flowered Tillandsia Lindeni, and a few Anthuriu Scherzerianum.

In the large Palm-house, it was remarked tha the fine Palms were in excellent health, and a nobl

specimen of Seaforthia elegans was in flower. The specimens of Araucaria excelsa in this structure have grown to be very large, being about 50 feet in height. Many interesting and beautiful aquatic plants, too, are here; and in a neighbouring large house some noble Palms, Cycads, fine specimens of interesting economic and officinal plants, and in the centre a noble plant of Medinilla magnifica, which annually bears close on one hundred and fifty of its large showy drooping racemes of rosy-crimson flowers—an almost matchless example of a specimen stove-flowering plant, beside which those we usually see at flower exhibitions are but pigmies.

In the greenhouses many pretty Ericas, Epacris, and other things of the class usually denominated New Holland plants, were in bloom; and the Succulent-house was well filled with curiosities, some or other of which are constantly opening their flowers. The Fern Rockery by Clapham is a fine piece of work, and its artistic planting under Mr. Findlay's direction has been excellent. One house was tastefully filled with flowers and foliage plants, the former consisting of Richardia æthiopica, Roman Hyacinths, Bouvardias, and Primula sinensis.

In passing through other of the houses, among many old things we observed two special favourites of bygone times showing forth with undiminished beauty, which found no rival in plants of the same class of more recent introduction. These were Witsenia corymbosa, a pretty Irid, more properly speaking an Aristea, and also known as Nivenia, a very old inhabitant of our greenhouses. Its branched woody stems bearing erect, linear, grassy leaves, and producing profusely its fine bunches of true-blue flowers, constitute it a very beautiful plant, and it has the merit of lasting long in flower, and being an ornamental plant when not in bloom. Reinwardtia trigynum is the other old-fashioned plant noted as being fine, especially when grown well and in quantity, as it is at the Royal Manchester Botanical Gardens. It is now nearly a century since it was introduced to British gardens, and for a showy, easily-grown, rich yellow winter flower there is still nothing to compare with it. Many hundreds of the bright yellow salver-shaped flowers were on the plants alluded to, and they made a charming effect, arranged with some of the showier of the scarlet Hippeastrums and other flowers.

Under glass, we never saw the plants here showing evidence of better care, and we are pleased to say that we found the energetic Curator in excellent health, and making light of the heavy task of remodelling and furbishing up the garden.

HOME CORRESPONDENCE.

DESTRUCTION CAUSED BY HAWFINCHES.—Few people know the Hawfinch, which is a very bold-looking bird when in full plumage, and about the size of a full-grown lark. They have a very massive and hard beak, which gives them the appearance of having a rather large head; being also furnished with a ravenous appetite, they are continually on the feed, therefore the damage that they do in a garden is surprising, especially to Peas. I have seen them attack a row 60 feet long, and in two hours they had spoilt all the best pods. The early varieties suffer mostly; they bring their young up on them, and as soon as the latter can fly, they are taken to the Peas, where the old birds will take a pod in their beak crosswise and crush it, letting the seeds fall on the ground, where are the young ready to pick them up; the bitten pods turn white. Hawfinches are easily frightened, and being quick in their movements, they are not noticed unless you are on the look-out for them in the garden. They also attack in the autumn the young shoots of Cryptomeria japonica by pecking their tips entirely off when about 2 inches long. At first I wondered why they did this, until I found out that they eat or nibble the end of the piece from mischief. My attention was drawn to this by their attacking a large pillar of Ivy, which I noticed dropped its leaves in a green state, and left the shoots quite naked, which began to die. I examined these shoots, and then found that these birds had bitten the tips off the shoots, also pieces of the rind for about 18 inches down the shoot. I could not find out the cause of the shoots dying, till one morning I saw a hawfinch fly from the Ivy, then I came to the conclusion that these birds were the misdoers, and the greater part of the Ivy plant was killed by them. They also will feed on the cones of Cupressus Lawsoniana when ripe, on the keys of the Hornbeam, and on Portugal Laurel berries. The buds of the Beech are attacked just as they are expanding, the heart being taken, leaving the two leaves which are about a quarter expanded. Beech Nuts and Mountain Ash berries are not beneath their notice. Just now the birds are feeding on the Broom seed (Sarothamnus scoparius). To show the hardness and strength of their beaks, they will crack the old seeds of the Laburnum as quickly as a linnet can canary seed. Both sexes are nearly alike in plumage, except that the hen bird has not so black a mark on the head, and the cock bird has a black throat which terminates in a point half way down the breast, the breast being of a light brown colour, changing to white as it reaches the tail. The fore part of the head is black, giving the beak, which inclines to be grey, a nice appearance. The back part of the head is of a rich dark brown, turning to a slate colour at the neck, a beautiful dark brown taking the place on the back, and getting lighter near the tail, the tail being white and brown. The shoulders are dark brown, the wing feathers white, black, and brown, four or five in the centre of the wing being of a blue tint, and curled at the ends, giving the bird a pretty appearance. *M. E. Mills, Coombe House, near Croydon.*

CONFERENCE TOMATO.—It appears difficult to suggest a variety of the Tomato so well adapted for indoor culture for market purposes as this—one of Mr. A. F. Barron's productions at Chiswick. I had last autumn several plants of it in pots in a low span-roofed house which has a raised bed on either side, and a walk down the middle. The pots were plunged in the bed to their rims, the stems carried up from 3 to 4 feet, until they reached the roof, and the stems were slightly bent and trained horizontally along the roof. The plants continued to fruit freely till late in the year, and in the space of 2 feet run three and four huge bunches could be found. The variety is of the Perfection type, very handsome, of good useful size, without being unduly large, produced in bunches of from nine to fourteen, which, in the majority of cases, come a good and equal size—not a few very large, and the rest quite small. It is its good habit, its remarkable freedom, the good average size of the fruits, and the way in which they travel, that constitute its claim to be regarded as a desirable market variety. The colour is all that can be desired, and the firm skin, added to excellent flavour, are other good points in this fine Tomato. It has been suggested, and with much force, that when Tomatos are exhibited, it should not be, as is customary, in the form of a dish of nine or twelve fine fruits of equal size, which may, perhaps, be gathered from several plants, but in bunches, which would be the means of setting up two good tests—namely, prolificacy, which is absolutely essential in the case of a good market Tomato, and the average size of the fruit on a bunch. The experience of the last five years has been against the cultivation of Tomatos as open plantations in gardens and fields. In Jubilee year—the summer being warm, bright, and dry—Tomatos did excellently in the open, and large crops were gathered, the plants standing well, owing to the general fineness of the autumn, until quite late in the season; since then I have seen them go down before the disease or early autumn frosts, until the Tomato-grower in the open has begun to despair. I think if much in the way of successful Tomato culture is to be done in the open air, the plants must be given walls and fences having a south and south-west aspect. Under such favourable circumstances, I think remunerative crops could be grown, provided the plants were well cultivated. Good culture and close attention are essential to success; without them, comparative failure would be pretty certain to follow. *R. D.*

FLOWERS UNDER DECIDUOUS TREES.—The question is sometimes asked, what sort of plants will grow satisfactorily under trees. I wish to relate my own experience in this matter, and describe how we have made a beauty spot under two very old Ash trees situated in the pleasure grounds near a main walk on slightly rising ground, and facing south. The first to flower is the pretty Winter Aconite, Eranthis hyemalis, always one of the earliest and hardiest flowers of the year, having opened its blooms on January 4 this year. It looks well planted in masses, and increases by seeds from year to year. We have not to wait for a succession, the welcome Snowdrop being already in bud. I am under the impression that if the bulbs of the latter be allowed to remain undisturbed for a few years there is a longer succession of bloom, and the masses look better than when annually planted singly. I have them in small clumps of thirty to forty bulbs. Of course, division is necessary sometime [No. Ed.], but it is the wisest plan to do it cautiously. The next to flower is Scilla sibirica, and these bulbs, if planted in groups of a dozen, afford a nice variety of colour, and they do well in the grass under trees, because it is shorter there. Anemone apennina enjoys the shade of trees, and I afford it a position midway between the two trees, and I may remark that I was able to gather fresh flowers from this particular patch at a time when those in the open borders were past their best. The brightest gem of them all is a lot of Cyclamen hederæfolium and C. ibericum, the former flowering in August and September, the latter in March and April. The plants appear to like a dry soil, for they are planted within one yard of the trees, and some Ivy roots do them no harm. The other bulbs which succeed in this spot are, Crocus vernus in variety, and Narcissus poeticus. Doubtless, there are many more which, if tried, would prove of use under trees, helping to clothe what would be otherwise bare land or starved-looking turf. Under other trees we have Hypericum calycinum, Vinca minor, Primroses, and Colchicum autumnale. On purpose to assist these various plants, a heavy mulching of rotted manure, mixed with mould, is afforded each year. *H. May, Markree Gardens, Collooney, Ireland.*

MANAGEMENT OF GOLD-FISH.—So many persons try their hands in keeping gold-fish in small indoor aquaria, and fail, that the following information from a recent issue of *Land and Water* may prove interesting and instructive. It was written on behalf of a person who had reported several failures to maintain his fish in good health. The writer, Mr. T. R. Sachs, states he has kept gold and other fish for years in a small aquarium in a conservatory with a north aspect. "The dimensions of the aquarium is 3 feet by 2 feet, and 2 feet in depth. It is supplied by a cistern from above, and enters the aquarium from below, the overflow or waste-pipe being on the surface of the water. I can then, by turning on a tap, have a constant flow of water. I have tried several methods of feeding the fish, and the best way to do so is to tie about 2 inches of raw fresh meat to a string, on which is a piece of lead to sink it half-way, the upper part tied on to a stick which lies across the top of the aquarium." In the aquarium are gold-fish, some roach caught in the Serpentine, and minnows, the last being such lively and frolicsome fellows. Mr. Sachs lays great stress upon the importance of proper feeding. "All farinaceous foods foul the water, over-swell the fish, and cause their death. The fish peck at the meat all day long, and it certainly amuses and fattens them. I have no weeds, as their growth adheres to the glass." There is no doubt that want of constant change in the water, and improper feeding, are the two main causes of want of success with gold-fish. *D.*

GREENHOUSE HEATING.—Doubtless there will be complaints during the last year of the amount of gas bills where coal-gas is used for heating purposes, either in gas stoves, or as a means of heating water for greenhouses. The weather during the year 1892 was very exceptional in character, as in this district we expect on an average of years about forty nights and twenty days when the temperature will be below the freezing-point, and artificial warmth becomes necessary to prevent plants in a cold greenhouse from damage. Instead of this number of occasions when heat was required, there were eighty-seven nights and fifty days when the thermometer descended below 32° Fahr., and twenty nights on which the temperature ranged from 20° to 11°. The duration of the frost and the continued low temperature meant a high consumption of heating materials in plant-houses, amounting to nearly treble that of the average. *Thos. Fletcher, Warrington.*

MEETING OF NURSERYMEN, ETC.—In the second or third week in September a series of nursery sales is held in and near London. These sales attract many provincial nurserymen to London. Could not some arrangements be made for a social gathering, which would afford the opportunity to many in the trade of meeting

together, and possibly of discussing matters of interest to the trade? Possibly an evening meeting might be desirable, or a dinner—the Englishman's delight. Or the Royal Horticultural Society might fit in one of its minor meetings, or the Nursery and Seed Trade (?) Association, [or the Horticultural Club] might initiate some plan which would bring the trade together. *W. B. S., Torquay.*

MARÉCHAL NIEL ROSE.—In "Wild Rose's" article on Roses in the *Gardeners' Chronicle* of January 28, the origin of Maréchal Niel Rose is stated to be unknown. It is a pity it cannot be cleared up, and I have often wondered if the old yellow Noisette, or the old yellow China, two Roses popular thirty to forty years since, had anything to do with the parentage of the Marshal. Both were very lovely yellows, but I think it was the yellow Noisette which had a great tendency to form a hard green centre at times. Both were lovely flowers when in fine character, and may have been probable parents. In speaking of Noisettes, "Wild Rose" does not mention Noisette Lamarque, a Rose which had a great popularity in the past, and I occasionally meet with it in conservatories, but not often nowadays; but in the half-developed state it is still a beautiful white Rose for florists' work, but it is now one of our neglected Roses. There used also to be another favourite white Noisette, La Riche, a fine variety for pillars and walls. With regard to Gloire de Dijon, of which the parentage is unknown, beyond it being a chance seedling in M. Jacotot's garden at Dijon, it is not impossible that the old Noisette Jaune Desprez may have had something to do with it, as a similarity in one or two respects exists. It was a very free bloomer, and formed seed-pods when we grew it in the South of England as far back as 1840, and it was then highly prized as a yellow-tinted Rose, and hardy, and a free grower. Another fine old Noisette, Aimée Vibert, which must be almost as old a variety, is still cultivated, and is a wonderful bloomer. It is to be met with frequently as standards, with large clusters of pretty white flowers and dark shining green foliage. I shall also be glad to have this opportunity of saying that at the next exhibition of the Shropshire Horticultural Society at Shrewsbury next August, liberal prizes are offered for a collection of Rose blooms, any kinds, to occupy a certain space, and it is to be hoped that some of our old-fashioned Roses may be seen in these collections, although the time fixed is late for the southern growers. At two exhibitions last year in July, in the Midlands, where large prizes were offered for Roses, collections of old-fashioned Roses were staged by Messrs. Cooling & Son, of Bath, and were much admired by many, ladies especially. It was a treat to the older horticulturists to see so many old favourites brought into notice again, and ample opportunities will shortly be given for much larger displays. *W. D.*

ALLAMANDA WILLIAMSII.—This is a very distinct variety, of a free-blooming habit; and where a great quantity of cut bloom is required most of the year, it is a great advantage to the gardener who is thus situated, that it will carry a good lot of bloom on quite a small plant, which is no small matter to the house decorator, as nice plants may be obtained in a 4½-inch pot. *W. Finch, Coventry.*

PRESERVED FRUIT.—It is difficult to avoid feeling some sympathy with the fruit preservers and bottlers, who seem very anxious to have a "look in" at the Agricultural Hall, when the Royal Horticultural Society conducts its first experiment of holding a great exhibition in the northern side of the metropolis in August next. Fruit preserving is now recognised as a very important horticultural industry. Tne manufacturers take in enormous quantities, not the surplus, but of the best average of our home-grown fruit, and thus give encouragement to hardy fruit culture, that but for these preservers would be altogether lacking. Practically, they save fruit-culture from becoming a ruinous enterprise, as in abundant seasons it might well be because they draw off from the markets such immense quantities of fruit, that it is found possible for growers to secure fair prices under adverse conditions. It is an error to assume that the preservers are content to take the surplus, and therefore the inferior fruit. So far from that being the case, the growers rather find these manufacturers to be satisfied only with the best, and it pays the grower only to produce the best for all the various purposes of preserving. It is obvious that they can present their commodities in a most attractive, nay, even beautiful form. It does seem as if, in this direction, the Britisher is fully capable of holding his own, and our people may fear no foe or competitor, come from whence he may. It is not enough that we heartily encourage fruit culture, we must equally give the fullest encouragement to the healthful and profitable utilisation in every direction of its products. *D.*

WINTER-BLOOMING GALANTHUS.—I am sending a flower of an Albanian Snowdrop, which has been blooming here since the third week of November. It is evidently a vigorous-growing kind, and of a very hardy constitution, as it has not received the slightest protection since it was planted outside in August. I have it planted in a western position at at the foot of a hedge. You will notice the glaucous whitish line running down the leaves, this is a peculiarity of the autumn-blooming kinds. *C. G. Van Tubergen, Jr., Haarlem.* [A form of G. nivalis. Ed.]

EARLY MELONS.

Without suitable pits or houses it is rather difficult to have Melons fit for dessert early in the year, even when the appliances at hand are as good as may be. Whilst writing this note, the fog has settled down over the entire district around us, and at the best the supply of sunshine so necessary for Melon culture is never quite sufficient; but other growers may be better situated in this respect than ourselves. Those who have robust plants at this date, and suitable structures in which to grow them, have the best chances of success. I myself prefer pot-grown Melons, if the bottom-heat is sufficient to keep the plants moving; and if this be furnished by a bed of manure or tree-leaves, care must be exercised to prevent root-burning. There is now no difficulty as regards early-fruiting varieties, but this is a thorny question that I do not intend to enter into.

Some gardeners think there is nothing to equal the older varieties, and deprecate the raising of new ones; although I think the latter must be allowed for some good reasons, such as the loss of flavour, and of form and distinct character, which is certain to occur in course of time.

To secure fruit at the end of the month of April or in May, large fruited varieties are not so suitable as small ones, which attain to maturity in a shorter period of time, and those with thin rinds should be preferred to those having a thick rind; also a scarlet-fleshed variety is better than a green or white one, although this latter point is, perhaps, a matter of opinion, but my observation has lead me to adopt it, a scarlet-flesh Melon with a thin skin becoming ripe from ten to fourteen days earlier than a green one. Another point in early Melons deserving of being mentioned is, that Melons with a smooth exterior will be ripe a few days earlier than a much-netted one. I give this for what it is worth, as such is my experience; and I have for the past few years made use of a variety with thin skin, and only slightly netted. I do not mention varieties by name, but feel sure that I shall not err in saying; the best certificated Melons of last year were small ones, with a thin skin and thick flesh. Small-fruited varieties are more economical than large ones, more fruits being grown on a plant. Those who may find a difficulty in raising early Melons, would do well to adopt the good old plan of sowing a couple of seeds on mounds of soil, when the bed is at the proper temperature, which will soon germinate. When it is seen which is the stronger, the other may be removed. Melons so raised grow rapidly if the mounds reach well up towards the light, and there has been no check. This plan is not to be advised with a new scarce variety, or when seed is not plentiful. When new Melons are grown, they should be apart from others, if seed saving is desired. As previously said, pot culture is best for early fruiting, a crop of, at least, three or four fruits being attainable in 16 or 18-inch pots, and the fruit ripens earlier than those from plants growing in a bed. This is a point worth taking count of when the bed is formed of manure, as the moisture arising from this sets up decay in the plants, or causes very strong growth of bine. Moreover, the bed settles as time goes on, and the stems being fastened to a trellis, drag on the roots, setting up canker. If pots be used, they may be fixed upon the hot-water pipes. With this firm base there is no settlement of the materials to fear. Pot Melons may be surface-dressed at various times. When Melons are in pots, the surface-dressings can be conveniently added as the plants appear to need them, moulding up the stem somewhat, and inducing the emission of roots. It is also easier to finish off the fruits satisfactorily when pots are used; whereas in beds the requisite dryness at the roots is not attainable just when it is wanted, hence loss of flavour.

In frames I like to have a hard coal-ash or slate bottom to the bed, rather than allow the roots a free run into the manure or leaf-bed. Owing to this, many varieties of Melons get condemned as bad-doers. In pots, rich top-dressings and manurial aids to growth may be applied when the fruits are swelling. It is not judicious to starve the Melons, especially early ones, but to apply assistance at the proper time, inattention to this point being a common cause of cracking and lack of flavour. No manure should be made into beds that has not been prepared by frequent turnings. If seeds or plants have failed, there should be no delay in replacing them. The potting-compost for Melons in pots or hills should consist of strong loam, with a small quantity of old Mushroom-bed manure. The top-temperature should not be less than 70°, or more than 75°, and the atmospheric moisture should be abundant in fine weather, but root-waterings should be sparse until the growth has become considerable. When planting Melons from small pots, every root must be retained, and the ball kept intact, making the soil firm about them. The bottom-heat should always be 10° higher than that of the pit or house. *George Wythes, Syon House.*

CULTURAL MEMORANDA.

CANNAS.

These brilliant-flowering plants have very hard seeds, which take a long time to germinate, so that to have good strong plants by the month of June the seeds should be sown forthwith. Previous to sowing, steep the seeds in tepid water twenty-four hours, and sow in an open and sandy soil, plunging the pots in a bottom-heat of 85° or 90°. The plants usually come somewhat irregularly, and the earlier should be carefully lifted and potted in very small pots, hence the need of their sowing. Grow the young Cannas on in moderate warmth, repotting them as they increase in size, and using a stronger and richer compost. A hot bed suits Cannas from the first and till they come into 48's, when, as the season is then getting advanced, a warm pit, say of a temperature of 60° by night, and 75° by day, would be a better place. Plants needed for beds must be hardened off in May, but those for growing on for the greenhouse should stay under glass. *H. Markham.*

Grevillea robusta.

Seeds of this useful decorative plant may be sown at this season. Sow in lightish soil pressed firmly in well-drained pots, and do not afford much water, after once watering the soil when sown, till they begin to grow. When the plants have made a few leaves, prick them off singly in very small pots, and grow them along, repotting them when the roots have filled the soil, if for use out-of-doors and for decorative purposes generally, until the size of pot is a 32 or a 48. As a means of keeping the foliage in the best condition, the plant must not suffer lack of water, or an occasional dose of manure, its beauty being spoiled when the lower leaves fall or become discoloured; dryness at the roots also favours thrips. These plants are very useful and hardy, and do not suffer from sudden changes of temperature, like

some others do. The plant is a perennial, which may be kept for years in a greenhouse, increasing yearly in size, and for some purposes in usefulness. *H. Markham.*

Gardenias.

There are few white flowers more useful, and probably more keenly sought after for button-holes, bouquets, wreaths, &c., than are the fragrant blooms of the Gardenia radicans, G. florida, &c.; still, in many gardens the amount of attention bestowed upon their culture is not equal to their merits. The plants get stunted, and not seldom they are allowed to become a prey to scale, mealy-bug, and other insects. With fair treatment, few plants are more easily grown or more generally attractive in leaf and flower. To work up strong healthy stock, the best time to strike the cuttings are the months of December and January. The cuttings should be clean, healthy pieces, and cut off with a heel by preference, or cut just below a joint. Prepare some small 60's, filling them with sandy compost, loam, and leaf-mould, and cover with half an inch of clean sand, and after watering the soil, insert the cuttings, affording tepid water when the foliage is dry. Plunge the pots to the rim in a frame having a brisk bottom-heat, placing a *cloche* or a handlight over them. Failing a hot-bed, the hot-water pipes in a forcing-house or stove may be utilised by placing a box 6 inches deep filled with moss, cocoa-fibre, rough leaf-mould, or the like, and plunging the pots therein. The box should be fitted with a close-fitting glass cover, which should be taken off occasionally and wiped dry, but it should not remain long off the cuttings, which root readiest in a steamy hot atmosphere. The bottom-heat should range from 85° to 90°. When rooted, divide and pot off, keeping them close in a hot-bed till rooting has begun afresh, when more air may be afforded them, or they may be removed to a shelf in the stove. The plants need to be stopped frequently the first year, repotted when the roots touch the sides of the pot, and to have a small amount of shade during bright sunshine, and plenty of water whilst growing, when the soil is filled with roots. *H. M.*

The Rosery.

Roses in Pots.

There are very few subjects that are so pleasing as a well-grown pot Rose, and although somewhat difficult to secure in perfection, when compared to many other plants, they are well worth a little extra attention and care. I do not think there could possibly be a better time than the present for starting the culture of pot Roses. Now that the days are well turned, they will come on rapidly with very little artificial heat, and much more naturally than if their forcing had been commenced in the latter part of last year.

To those who do not already possess plants of suitable varieties, I would recommend their purchasing the following. It is of great importance to have those kinds which open their flowers freely, and produce them more or less upon the points of every young growth; and I have found those named to have these qualities in a high degree:—Anna Olivier (rosy-flesh and buff), Catherine Mermet (light flesh, very sweet), The Bride (white), Dr. Grill (coppery-yellow), Ethel Brownlow (deep pink), Francisca Kruger (copper, shaded peach), Goubault and Souvenir d'un Ami (pinks), Innocente Pirola (creamy-white), Niphetos (white), Madame Falcot (apricot), Madame Hoste (yellow and white), Madame Lambard (red), Perle des Jardins (golden-yellow), Rubens (flesh), Safrano (apricot), Sunset (deep apricot). All of these are good growers, but not climbers.

The following are six well suited to grow in pots on the long-rod system:—Gloire de Dijon, Madame Chauvry, Maréchal Niel, Reine M. Henriette, William Allan Richardson, and Madame Carnot.

Up to the present, I have only named Tea-scented and Noisette varieties, as I consider them much better adapted for pot culture than the hybrid perpetuals. The following six, however, are grand:—General Jacqueminot (deep scarlet), La France (pink), La Rosière (maroon), Duke of Edinburgh (scarlet), Fisher Holmes (velvety-red), and Baroness Rothschild (pink). These can be obtained established in pots. If not so established, they are unsuitable for forcing, and should be grown on ready for early forcing next season.

The hybrid perpetuals would probably be in 6 or 7-inch pots, and the Teas in a 5-inch size. Now, the former may well remain in the same size pot, care having been taken to see that the drainage is clear. But the Teas are much better if shifted on into pots two sizes larger than they are occupying when purchased from the nursery. It is not nearly so necessary that this class be pot-bound; indeed, as they naturally flower so much more freely than the hybrid perpetuals, it is well to afford them facilities for making more growth.

In repotting these, that is if the plants have been doing well, it will be found that many of the roots have got matted around the crocks at the bottom of the pot. I would not trouble about picking the crocks out from among these, unless they came away easily; this cannot be done without injuring the roots to a great extent. Now, a word or two as to compost. Almost every writer recommends turfy loam. Well, turfy loam is a splendid thing, if it can be got, but it is probably the most difficult to obtain of all garden materials. I grow a large number of Roses in pots without it. Clean weeds, vegetable refuse, and decayed leaves will answer our purpose almost as well. By clean weeds, I mean such as grass weeds—not any Bearbine, Couch, Thistle, &c. The grass-weeds have a quantity of fine roots, and when rotted, possess much of the root-fibres so valuable in turfy loam. If you turn over such a lump of weeds, &c., as I have described, and incorporate a little well-decayed manure among it, a compost is made that is well suited for Roses.

Having knocked the Rose out of its pot, remove what little surface soil you can without disturbing the roots, and pot it deep enough for the new soil to cover about an inch more of its base than was previously the case. Pot firmly, using a rammer to press the soil down between the old ball and the pot. The next item is pruning; and here we need some care and thought, as much depends upon the variety and its habit of growth. It was with this view that I put all of one habit together when naming the most suitable varieties for pot-culture. The first batch of varieties should be pruned fairly hard, cutting out all very weak growths and side-shoots, and shortening the others back to within 4 to 6 inches of the shoulders they break from. By continuing this process each year, and by cutting the flowers with long stalks, if these are required as cut flowers, the plants may be kept in a compact and more useful form than would otherwise be the case.

Amateurs very seldom cut their Rose blooms with stalks long enough to be of real service when there is not the least reason why they should not be cut off double the length. Whenever a Rose is cut, the resulting new growth starts from the two or three eyes nearest the end of the wood. Now, if these blooms are also cut with short stems, your plant soon covers a lot of space, leaving the centre comparatively bare. Therefore, cut the Rose blooms with long stalks; it keeps the plants in better shape, and the blooms themselves are doubly useful for decorative purposes.

The strong-growing climbing varieties need a different system of pruning. This is practically done in the summer. I will presume that plants are bought from the nursery this spring. They should be at least in a 7 or 8-inch pot, and carry one or two shoots, 6 to 9 feet long. Only the extreme tip of these shoots will need removing at the present season. If you are growing several plants of this class, it is well to stand them side by side where there is the most space, and then train them in a slanting direction, somewhat on the same lines as cordon fruit trees. Or they may be stood near to the wall of a span-roof, and then trained to the roof similar to Vines. This induces a far more uniform break of young growth than when they are grown to stakes that are quite upright. Providing the wood was properly matured, almost every eye will produce a bloom. But, unlike the more bushy-growing varieties, these climbers will only give one good crop of blooms each season; and, as soon as this is secured, they should be grown on with the object of getting more wood suitable for flowering the following year. Directly the flowers are off, cut the shoots down to the point where other strong growths are already starting from near the base of the plant. This, to the average amateur, appears rather ruthless treatment; but the growth that has already flowered is of very little future use, and it is much best to throw all of the plant's energies towards producing other strong growths for the next flowering season.

Do not attempt to force wood that has had the late severe weather upon it. Wood that has been thoroughly frozen is not suitable for forcing, and seldom returns a satisfactory crop. Trade growers are well aware of this, and during hard weather keep their plants under cover of cool-pits, &c.

Having potted and pruned our Roses, the next thing is to give them a suitable temperature. Far more often than not, the plants are placed in too high a temperature at first. This causes the sap in the wood to move, and push the eyes on too soon for the roots to be able to meet the supply of sap demanded. In this case the shoots grow some 3 to 4 inches, and then receive a slight check, which is decidedly injurious to them. A little thought will show us how unnatural this is. Spring and summer come upon us by almost imperceptible degrees, and yet many will introduce a plant into what is practically a summer temperature at once. I have no hesitation in saying that a steady rise in the temperature, from quite cool treatment, will secure flowers equally as soon as if the plants were introduced to the maximum heat at once, while the number and quality will be far in advance of those receiving the latter treatment. A temperature of 45° F. is quite sufficient for the first three or four weeks, rising another 5° at similar intervals, until the thermometer registers 65° to 70°.

From the very first, war must be waged against insects and mildew. This is easily accomplished if a start be made on the right lines. I syringe my plants frequently, and never without using a little insecticide in the water. I have tried many compositions; in fact, I may say, almost all of them. The bulk of them are very good, but none is better or cheaper than the following: Boil a pound of the best soft soap in a gallon of water. When boiling, remove from the fire, and while still hot, add half a wineglassful of the best petroleum, and about two tablespoonfuls of flowers-of-sulphur. Thoroughly stir this together, and use at the rate of a pint of the mixture to 3 gallons of soft water warmed to a temperature of 75° to 80°. During the first month, I would still further reduce this—say, one-third. If this mixture be used about three times a fortnight, no insect pests will infest the Roses; but it is necessary to start using it early, as once they obtain a hold it is very difficult to eradicate them without injury to the tender points of growth.

Some varieties, notably Niphetos, frequently have their flower-buds turn black when no larger than just visible to the eye. From careful observation, I have come to the conclusion that this is almost always due to drought at the roots, or extreme measures in syringing and fumigating; indeed, I always avoid the use of tobacco as much as possible, the fumes of which are so unnatural, and not nearly so efficient a cleanser as a weak mixture of the insecticide I have just described.

As the Roses begin to grow, they will benefit much from weak liquid-manure twice a week. Roses are by no means such gross feeders as many imagine, and are much more often over-fed than under-fed. Ammonia in some form is a great help towards healthy and glossy foliage. I scatter a little animal manure-water—such as the drainings from a stable—

among the plants occasionally, and find the foliage feeds upon it with marked effect. It also assists in keeping down insects. The newly-potted Roses should not have any manure-water until their roots have thoroughly permeated the fresh soil; such water having a tendency to make the soil stale and sour, unless the manurial qualities can be quickly absorbed by the roots. A draughty current of air must be avoided; so, too, must dryness at the roots. These are the chief causes of mildew, but with the help of the sulphur and petroleum, this insidious blight or disease will be unable to get a footing. Sulphur used in the proportions I have given is not unsightly; and when used in the mixture, comes into contact with the whole of the plant in a much more uniform manner than when applied in any other form.

By the end of June and July, there will be little benefit derived from pot Roses, and they may now be stood out-of-doors, or receive all the air possible, so as to secure a better ripening of their wood, and which will now be in sufficiently forward a state to be equivalent to autumn growth out-of-doors. Plenty of air, and the first slight frosts of autumn, are very conducive to well-ripened wood; but the plants should be housed again before severe weather returns. *A. P.*

THE APIARY.

DRONES IN HIVES.

Hives are sometimes found to contain drones at this season, which is a sign either that the colony has no queen or that an unfertile one is present. When bees from any cause lose their queen late in the year, they do not kill the drones, and these live till the following spring; but it sometimes happens that the queen gets lost after the slaughter of the drones has taken place. The bees start queen cells, and in due course a young queen is hatched, but as there are no drones she does not get fertilised, and, therefore, must always remain a drone breeder. As there is no possibility of buying queens for some time to come, the only remedy is to unite the stock to another standing near, and the sooner it is done the better. Flour is now generally used for uniting stocks, and if each lot is lightly dusted with it there will be no fear of any fighting taking place. It may appear strange to advocate uniting bees in February, but we often get a mild sunny day when such an operation can be performed without any risk of their getting chilled or injured in any way.

Stocking "Wells'" Hives.

In order to get the full advantage of the double queen system, "Wells'" hives should have the bees put into them as early as possible, if it was not done last autumn. The success of the system depends entirely on the strength of the colony at the time of the honey flow, and the longer the bees have the advantage of the extra warmth, so conducive to brood rearing, which is generated by the two lots being so closely connected, the more likely they are to be in readiness at the right moment. *Expert.*

SOCIETIES.

EDINBURGH BOTANICAL.

January 12.—The above Society met on this date, at 5, St. Andrew Square; Dr. D. Christison in the chair.

Mr. R. Lindsay, Curator of the Royal Botanic Gardens, exhibited the following plants.

1. A fruiting specimen of an Aroid, Nephthytes liberica, N. E. Br., which was first introduced into cultivation by Bull in 1881. Its clusters of bright yellow berries were very effective.

2. A young plant of a Bromeliad grown from seed sent to the garden by Mr. J. Graham Kerr, and obtained by him during the Pilcomayo expedition. This plant is known to the natives of the Grand Chaco as the water Caraguata, because the heavy night dews condense on the leaves, in the sheathing-bases of which the water collects. The natives of these dry regions where the soil is impregnated with salt, depend to a considerable extent on these plants for supply of fresh water. A pint of pure water may often be obtained from an adult plant.

3. A branch of Thuia orientalis var., showing russet-brown tints on the tips of the twigs in winter, and golden tints in summer.

4. Fruits of Celastrus scandens, the "Bittersweet" of America, brought from Minnesota, by Mr. J. Orr, and sent to the Society by Dr. Wilson.

Professor Bayley Balfour exhibited a branch of Abies nobilis sent by Sir James Gibson Craig, of Riccarton. It was covered with large tubercles, due to a peculiar development of the cortex. Professor Balfour also showed a number of cultures of bacteria on jelly and agar-agar prepared in a permanent form for museum purposes.

Dr. Christison exhibited an Australian photograph of a tree said to be the largest in Victoria, and measuring 57 feet in girth and 450 feet in height. He also showed a panel about 3 feet square, veneered on both surfaces with walnut of a very high quality obtained from a large tree grown at Otterstone, Fife. This tree was 15 feet in girth, and supposed to be about 300 years old. The panel was afterwards presented to the museum of the Royal Botanic Garden by Dr. Christison. It is one of the finest examples of Walnut ever grown in Scotland.

Mr. J. Graham Kerr read a paper on "The Botany of the Pilcomayo Expedition," and mentioned a number of new plants which he had found. The paper was illustrated by photographs exhibited by means of the limelight.

Professor Bayley Balfour read a note on tubercules found on the roots of a plant of Agathis excelsa grown in a tub in the Botanic Gardens. A fungus had first attacked the tub, and then the rootlets, which had entered the decayed wood.

Mr. R. Lindsay read the report on the temperature and vegetation of the Royal Botanic Garden for December, 1892.

The weather of the past month was of an exceedingly wintry character. Frost was registered on twenty-three mornings, indicating collectively 192° of frost for the month; so much frost has not been registered at the garden for December since 1879. During the corresponding month of 1891, frost was registered on eighteen mornings, the total amount being 83° only.

The lowest readings of the thermometer for last month occurred on the 3rd, 16°; 4th, 16°; 25th, 15°; 26th, 12°; 27th, 13°. The lowest day temperature was 24°, which occurred on the 25th of the month; and the highest 56°, on the 18th.

On the rock garden only one plant came into flower, viz., Primula inflata. A special feature is the deep russet-brown tints of the foliage of the varieties of Thuia orientalis, which, on the south sides of the plants is much more pronounced than on the north, giving them a very curious appearance. During summer the brown tints disappear, and assume a golden colour.

The total number of species and well-marked varieties which have flowered on the rock garden during the year 1892 amounts to 1211, as against 1216 for 1891. The largest number came into bloom during the month of June. A record has been kept showing the date when each plant was first observed in flower. The number of species which came into flower each month was as follows: January, 7; February, 31; March, 39; April, 119; May, 282; June, 330; July, 237; August, 103; September, 45; October, 15; November, 2; December, 1. Total, 1211.

BANFFSHIRE HORTICULTURAL.

January 20.—The annual general meeting was held at Banff on the above date. A statement of the year's transactions was submitted and approved, showing a satisfactory balance in the society's favour. The Duke of Richmond and Gordon and the Duke of Fife were then elected presidents. The lady patronesses, vice-presidents, and committee, both professional and amateur, were re-appointed. Mr. R. G. Mann was re-appointed to the office of secretary and treasurer. The annual exhibition and games was fixed for August 16. A discussion arose as to the advisability of continuing the exhibition of industry and art to be held conjointly with an autumn show during October, but it was agreed to adjourn the meeting, and meet again the following Thursday to discuss the matter fully.

ABERDEENSHIRE GARDENERS' AND FRUITERERS' ASSEMBLY.

January 20.—The annual assembly of the above was held with great *éclat* in the Royal Albert Hall, Aberdeen on this date. Mr. A. R. Gray, Aberdeen, presided during the social meeting, and was supported on the platform by many of the leading local seedsmen and fruiterers. In the course of his introductory speech, the chairman said that among the many honourable existing trades, the occupation of a gardener stood foremost, and it was certainly the most ancient trade. It was the trade that kept the world going, for what was the farmer's work but a form of gardening? And on this and other branches of gardening depended the success of all manufactures. Besides supplying food, it supplied the materials for manufactures, and this fact alone was sufficient to show that the gardener's occupation was the most useful as well as the most ancient in the world. It was the only trade that could stand alone. In reviewing the progress that had been made in the fruit business during the past twenty years, it was hardly possible, Mr. Gray said, to understand and credit the great and rapid advancement. Twenty years ago they were almost entirely confined to fruits grown in this country, with small supplies from Holland and such countries, but of late years nearly all the countries in the world had been opened up, and fruits from almost every country and clime found their way into our markets. Nor was the fruit trade to stop where it was—it was rapidly increasing, and it would continue to do so for a very long time.

DEVON AND EXETER GARDENERS' ASSOCIATION.

January 25.—The fortnightly meeting of the Society was held at the Guildhall, when the attendance of members was large. Mr. G. Lonsdale occupied the chair. The essayist was Mr. E. Sparks, the Earl of Iddesleigh's head-gardener at Pynes, the subject dealt with being "Zonal Pelargoniums." Mr. Sparks being one of the best growers of this class of plants in the neighbourhood, his paper teemed with practical knowledge, useful suggestions, and much information that is essential to the successful culture of this useful class of plants. In taking cuttings from old plants, he recommended taking them off at the joint with a slanting cut, placing the cuttings singly in small thumb-size pots, using a compost consisting of two parts fibrous loam, one part well-decayed leaf-mould, and one sharp sand. August or September—or earlier, if possible—is the best time to do this. In April these cuttings, now rooted, should be shifted into 6-inch pots, using for compost two-thirds fibrous loam, one-third well-rotted cow-manure, and a little coarse sand. If wanted for exhibition in August, shorten the growth in April by cutting off straggling shoots. They will then break into new and sturdy growth. At this season they want assistance in the way of manure in liquid form. Of course, the very large specimens seen at shows are two and three-year-old plants, which have been cut hard back in autumn, and trained in spring. It is well to pinch off the early flowers, as this will eventually produce stronger trusses and larger blooms. The plants should be, when grown indoors, shaded from hot sunshine, which causes them to drop their petals. Mr. Sparks emphasised the fact that early cuttings were best, growing more vigorously, and became well established before the winter set in.

AMERICAN AND BRITISH APPLES.

One must feel puzzled when the price fetched by home-grown produce is compared with that obtained for American. Many besides myself advocated a few years ago an extension of our orchards, the renovation of old ones, the cutting down of unhealthy trees, and replacing them with the best-looking and longest-keeping varieties; while healthy trees of undesirable varieties were to be cut back, and grafted with market varieties well suited to the soil and locality. Since that time great strides have been made in several directions in this matter of fruit-culture, and a large amount of capital expended moreover, cottagers are in many instances developing into skilful cultivators, and farmers and fruit-growers generally are becoming acquainted

with the best methods of selecting and packing their fruit for the market than was formerly the case. Many persons averred that when the amount of our produce was increased, and packing and selecting were improved, the American competition would be materially reduced; but it is not so. Really good-sized, clear-skinned, and well-coloured Cox's Orange and Blenheim Orange Pippins having realised at the best only 5*s*. 6*d*. per bushel wholesale; and since the American fruit arrived, the price has ranged from 2*s*. 6*d*. or 3*s*. at the utmost.

I enclose a fair sample of the two varieties named, which realised the above price. [Fair-sized fruit of good colour. Ed.] *Per contra*, a barrel of Americans containing about 3 bushels, realised 40*s*., or nearly 14*s*. per bushel—and this for fruit of small size, spotted, and very inferior in quantity, I have ever tasted of the New Town Pippins. [We believe there is a spurious New Town Pippin being sent over by Sam Slick's countrymen. Ed.]

Now, surely it is not the quality of the fruit that the British public are anxious to get, but the foolish hankering after that which is grown abroad, for not only is it so in London, where glutted markets are of frequent occurrence, but also in Manchester, as a correspondent informs me. The demand is all for Americans, while good home-grown fruit is passed by unheeded.

There cannot be very large supplies of home-grown Apples this year, judging by the returns of the fruit crop in the *Gardeners' Chronicle*. In most of our orchards early varieties of Apples largely predominate, so that there is no housing required, the fruit being sent to market when gathered, and by the middle of the month of October the growers are nearly cleared out. And taking into consideration the amount of labour saved with early sorts, compared with late ones, even when low prices rule, it pays better to grow them than the late varieties. Those which I would recommend to be grown are Lady Sudeley, Worcester Pearmain, Mr. Gladstone, Lord Suffield, Warner's King, Ecklinville Seedling, Cellini, and Lord Grosvenor. These would be mostly sold before the Canadians come over. Late ones will not pay in the future as in the past, for the simple reason that, after the Canadians are at an end, the imports from Tasmania and Australia take their place. There is one class that may bring to bear a balance in the demand for home-grown fruit, and that is the local and the town tradesmen; the former must well know that it is to the interest of all parties concerned to encourage our local and home industries, and if they abstained from purchasing for their customers the imported fruits till the home supplies were getting cleared off, they would find that their trade would increase in volume. The farmers and fruit-growers would get a fair interest on their capital, more labour would be employed, which again means more customers, and the owners of land would receive a fair rent. The owners in their turn would spend more in the locality, and so encourage trade and sport. Many large owners of land are among the first to purchase imported Apples, and yet they are daily deploring the poor returns that they obtain for their land. I do not find fault with foreign fruit coming to us, but that it is sold to the exclusion of what is home-grown. Some persons may say that it is worst of all to have none at home, and not be able to buy elsewhere; but this is hardly likely to be the case again, nearly every part of the globe being now in communication with us, so that in a few weeks our needs would be supplied at very short notice. *A. Evans, Haslemere.*

NOTICES OF BOOKS.

A Text-Book of Tropical Agriculture. By H. A. Alford Nicholls, M.D., F.L.S., C.M.Z.S. With illustrations. (London: Macmillan & Co., 1892.) (Crown 8vo, pp. 312.)

Following closely upon the *Manuel Pratique des Cultures Tropicales*, by P. Sagot and E. Raoul (lately noticed in these columns), we have here an introductory Text-Book of Tropical Agriculture, probably the first of the kind published in this country. It differs from the works hitherto dealing with tropical agriculture in being a text-book adapted not only for use in colleges and higher schools, but also for the guidance and instruction "of peasant proprietors, owners of small estates, and intending settlers in tropical countries." In fact, it is intended to do for tropical industries what the *Elements of Agriculture* prepared by the Royal Agricultural Society of England is designed to do for the rural industries of this country. The history of the work shows that it has already received high approval. The Government of Jamaica offered a premium for the best Text-Book of Tropical Agriculture, and the award was made to the manuscript of the present author. This manuscript, with a considerable addition (forming the second part of the work), was published by the Government of Jamaica in 1891, and since that time the book has been adopted by the governments of other Colonies, "indicating" as the author justly claims, "that it has supplied a distinct want." The author and publishers have done well to bring out the present edition, and we are sanguine enough to anticipate a favourable reception for it. Under the press of keen competition, and of the vast extension of cultivated areas within tropical regions, it is necessary for planters to cultivate, not only highly but economically, to grow only such produce as can be easily disposed of in the world's markets, and to be prepared at a short notice to enter upon any new industry that offers a more favourable opening than the old. In a word, they have to exercise greater intelligence and forethought than formerly, and they have to be in touch with all that concerns their special enterprise in nearly every part of the world. All this cannot be accomplished at once. Hence, the more enlightened colonial governments, such as Jamaica, begin by introducing the subject into schools and colleges, and by teaching the principles of tropical agriculture side by side with other branches of education. Dr. Nicholls has had the right training to qualify him for his present task. He tells us that twelve years ago when he had to direct his attention to tropical agriculture, he found difficulties constantly cropping up in his path, but there was no practical book that could give him exactly the help he required. These difficulties have, we know, been overcome, and this book, the result of his own observation and experience is "intended as a guide for the young and unlearned, to whom such details as it contains are likely to be of essential service." In the elements of agricultural science, forming the first part of the book, there are discussed very fully—and withal clearly and pleasantly—all the leading facts connected with soils, plant life, manures, rotation of crops and tillage operations, while the whole of the second part is taken up with simple and practical hints respecting the cultivation of numerous tropical products. It is this latter part which the author has made specially his own. His advice is at all times sound and sensible, and all who are "not content to follow in the old grooves of unscientific agriculture" may turn to this little work and pick up very valuable hints respecting the cultivation of numerous "minor industries."

The advance in material prosperity made in the West Indies during the last twenty years has been singularly striking, especially in the cultivation of fruits, spices, and fibrous plants. It is generally acknowledged that this advance is due, in a great measure, to the energy and intelligent efforts associated with the various botanical institutions that have been established there, and to the powerful aid of Kew. We notice that in recognition of the share taken by Kew in the work of regeneration in the West India Islands, this text-book is very appropriately dedicated to Sir Joseph Hooker. Dr. Nicholls (although not in the botanical service) has for many years acted as "Kew correspondent" for Dominica—succeeding in that purely honorary but useful capacity, the late Dr. Imray, to whom Dominica (and, indeed, the West Indies generally) became indebted for the introduction in a practical form of the Lime-juice industry. It is a sign of the times that many of the old industries are gradually giving place to new. The "sugar islands" are fast becoming fruit and spice islands, and as they are placed geographically as to become the "Channel Islands" of the United States and Canada, it is only reasonable to suppose that the increase of their present prosperity is founded on a more permanent basis than that of a century ago, when slave labour and high protective duties gave them wealth and position of a precarious character. Now that Coffee has almost been driven out of cultivation in eastern countries by the attacks of the Coffee-leaf disease, there is a good field for enterprise in the rich lands of tropical America. Cacao is essentially a new world industry, and it is becoming more widely cultivated in all British possessions. Tea and Cinchona have been successfully grown in Jamaica. Nutmegs and Cloves are so thoroughly at home in the lovely island of Grenada, that this has been rightly named "the spice island of the west." Of fruits, the Orange, Lime, Banana, Cocoa-nut, and Pine-apple form a large share in the yearly exports of Jamaica, Trinidad, and the Bahamas. Ginger is a staple product of the hills of Jamaica, while Cardamoms, Pepper, Vanilla, have been recently introduced, and are becoming established experimentally at most of the botanical experimental stations. The list might be almost indefinitely extended, but we notice that Dr. Nicholls regards Coca, Jalap, Sarsaparilla, Annatto, Tumeric, Logwood, Indigo, Maize, Rice, Guinea-Corn, Cassava, Arrowroot, Yams, Tania, as all within the range of remunerative cultivation at the present time. It only remains to add that the book is well printed, and nicely bound. It has several illustrations (all good except the one representing the Coca plant), and there is a suitable index. The botanical names are, as far as we have tested them, correctly given, and altogether we are satisfied the book is one that can be confidently recommended. *D. M.*

The Ferns of South Africa: *containing Descriptions and Figures of the Ferns and Fern Allies of South Africa, with Localities, Cultural Notes, &c.* By Thomas R. Sim, F.R.H.S., and published by J. C. Juta & Co., Cape Town, and Johannesberg; Wm. Wesley & Son, Strand London, 1892. 8vo, 275 pages, 159 plates.

The author of this book is probably known to most of our readers as the writer of the *Handbook of Kaffrarian Ferns* (1891). The present work contains descriptions and plates of all the Ferns and Fern allies known to exist in that part of continental Africa lying south of the Tropic of Capricorn. It is needless, however, to state that nearly half this area, including the whole region north of the Orange, Vaal, and Umvolosi Rivers, is still almost a *terra incognita*, even as regards its physical features, and much more so as regards its botany, and doubtless contains many still unrecorded species. Mr. Sim classifies his localities under the seven regions mapped out by Mr. Bolus, in his *Sketch of the Flora of South Africa*, 1886. Seventy-five species are found in the south-west district, which includes:—

a. The coast slopes from the mouth of the Olifant's River on the West Coast, to the mouth of the Grooté River on the East Coast.

b. The Karroo and Namaqualand.—Seventy-eight species are found in the south-east district, extending from the Grooté River to the Fish River and up to the Winterberg and Sneemberg Mountains. Eighty-nine species are found in Kaffraria, from the Fish River to the Natal Border; 130 in Natal, and sixty-one in the Transvaal. As regards nomenclature and species limitation, Hooker and Baker's *Synopsis Filicum* is followed with very small alteration. We notice that in the table of p. 34, Mr. Sim gives the number of species in Madagascar as 144, and has not taken in account the Ferns which have been added to the flora of this island by the explorations in recent years of Mr. Barron, Miss Helen Gilpin, Mr. Scott-Elliot, and others, which run up the number above 350. The number also for

Tropical Africa is founded on Kühn's *Filices Africanæ*, and is not on the same scale as those founded upon the *Synopsis Filicum*. Compared with the whole flora of South Africa, the Ferns are remarkably few in number, for as it is estimated that there are 10,000 species of flowering plants within the area examined, Ferns only form 1½ per cent., while in Australia, with about 9000 known species of plants, they form 2⅔ per cent., and in several sub-tropical islands they form from 20 to 50 per cent. of the whole flora.

Mr. Sim gives several interesting introductory chapters on Ferns, the parts of Ferns, on their reproduction and propagation, and on the cultivation of Ferns. This chapter contains many useful hints on the different treatment required for various species. Another chapter gives us notes on the identification and preservation of specimens, and another tells us of the collectors who have travelled at the Cape, and the various works on Cape Botany, more particularly those treating of the Ferns of South Africa. We note on p. 23 that the name of Mrs. Baker is given as having brought together the new Ferns in a paper in the *Annals of Botany*. We are not aware that this lady, who is great upon domestic economy, lays claim to rank as a botanical authoress. There is also a chapter on distribution, amplified by lists showing how the Ferns are distributed throughout the geographical areas adopted, what species grow only in South Africa, what species grow also in other parts of Africa or the African Islands, and also it shows in the case of species growing in other countries, what continents they inhabit.

The descriptions are worked out with much care from living specimens where these were obtainable, and from dried specimens in Cape herbaria. The figures are also the work of Mr. Sim's own hand. We hope that this book will give a renewed interest to Pteridology in the colony, and have no doubt that it will be popular with amateurs and others, and will help them to enjoy the study of one of the most beautiful, interesting, and easily understood orders of our South African flora. It may interest our readers to know that Mr. Sim was trained at the Royal Gardens, Kew, and has been for some years curator of the Botanic Garden at King William's Town, South Africa, and that he was successful in winning the Jubilee Gold Medal Offered by the North of Scotland Horticultural Association. The book does him great credit.

Trade Notice.

A new Gardeners' Directory is said to be published at Manchester, and a canvasser has been soliciting orders, and receiving money in advance for it meanwhile, the publication has not, so far as we know, appeared. Is anything known concerning it?

Trees and Shrubs.

LAWSON'S CYPRESS, HASKINS' VARIETY.

Mr. H. Haskins, Branksome Nursery, Bournemouth, sends us a small spray of a seedling, raised by him, in which the young shoots for nearly half their length are of a rich orange-yellow colour, much deeper in tint than the aurea variety. Judging from the sample sent, we should esteem the new variety very highly.

Variorum.

Bananas for the Table.—There are as many kinds of Bananas as there are kinds of Apples—medium-sized ones, such as we see in the North; big ones, a foot long; thick ones, almost like small Musk Melons; and little ones, only 3 or 4 inches in length. When you visit a fruit-stand you are likely to select the biggest and handsomest Bananas you see, and there is just where you make a mistake. The smallest Bananas are in nearly all cases the sweetest and juiciest, the tiny "Fig" Banana being the best of all. The rind should be thin, and there should be no ridges or corners to it. The larger the ridges the coarser the fruit. The Plantain, which is the very coarsest kind of Banana, has enormous ridges. This species is not fit to eat without being cooked; but when boiled, or baked, or fried, is delicious Any coarse Banana—that is, one having a thick rind with large ridges—is good for cooking. All Bananas contain starch while green, which, upon ripening, is changed by Nature's wonderful chemistry into sugar. Now, if the Banana is taken just after its rind has begun to grow golden, but is still streaked with green, it will contain a great deal of starch, which will make it palatable when cooked, while the small amount of sugar which has been formed will give it a sweetness like a Sweet Potato. Strip the rind off, and boil it until soft, and it will make one of the nicest vegetables you ever ate. It is one of the commonest sights along the Amazon to see groups of half-clad Indian men and women squatting around little camp-fires roasting Bananas, and having endless mirth trying to pick them out of the hot coals without burning their fingers. We are all used to fried Bananas, but we are prone to forget that, for this purpose, they should not be fully ripe, as that makes them too soft and too sweet. Above all, a Banana roasted or fried should be served hot, for, as soon as it becomes cold, it grows tough and unpalatable. *Grocer and Trade Journal.*

Trees in Towns.—In large cities the necessity for open spaces—lungs—has not only been recognised, but provision is being rapidly made for the wants of the present generation and for those to follow. The existing open spaces in London, for instance, attract residents into the immediate vicinity, and landlords especially are well aware of this fact, and take advantage of it. Speculative builders are also awake on the subject, and new streets rise in the suburbs enlivened by rows of trees suitable for growth in the metropolis. Public-spirited vestries have taken the matter up, so have the County Council, and in the near future we may expect to find all London streets capable of accommodating them, garnished with trees and shrubs. And all this is as it should be. It may here be noted that inquiries have been made in seventeen London districts with respect to the presence of trees in them, and it has been found that only three of them are at present absolutely treeless, while the number of trees in the public highways of the other fourteen districts is 14,700. Of this number 5158 have been planted by Boards and Vestries, and 5323 have been placed in position by builders and other private persons. There are 2712 in the Hampstead district (included in the first total), but a very small number of these were planted at the cost of the vestry—and the number planted by builders or property owners cannot be given with any certainty. We are further informed that, besides the expense of purchasing and planting, the average cost of maintenance is about 1*s.* 3½*d.* each tree per annum. In some instances, in the case of new streets, we are told that the trees have to be protected—in the first instance with guards, at the cost of the owners; in one district alone are they properly guarded and staked, and the cost included in the apportionments. In eight districts wooden guards are used, and in one expansive metal guards are set up. In Hammersmith, trees are not allowed to be planted in streets of less than 45 feet in width, and Streatham is restricted in this regard to streets of not less than 40 feet in width. Many have been the mistakes made in planting and in selection, but on the whole we are getting into the right track. Similar errors have been made in the cities of the United States; improvement is being effected there as well as here, and in connection with this we note a lengthy illustrated paper, by Mr. W. Saunders, of the United States Department of Agriculture, and issued as a Government paper for general use. It is entitled, "Trees in Cities and on Streets;" the subject being treated under the headings:—Selection of trees, trees for general use, trees for special use, preparation of the soil, preparation of the trees, distance apart, time to plant, planting, box guards, pruning, insects, gas leakage. Mr. Saunders speaks with much authority on his subject, and, if attention be given to his instructions, much valuable time and timber may be saved—the former of great importance to our go-ahead cousins, the latter daily becoming more so. It is pleasant to note how the love for trees and vegetation is spreading, and that it is being gratified in all industrial hives.

Coffee Cultivation.—It is simply astonishing how much adulteration in articles of food the public will put up with—notably in Coffee. Sometimes it is very hard to say, outside of the laboratory, what packets of "fancy" Coffees are made of. Complaint has been made before courts of summary jurisdiction that some samples contain only 30 per cent. of Coffee; and not very long since a well-got-up sample was found to contain only 15 per cent.! True, the matter of adulteration was not detrimental to health, but it was not what was paid for. It is a fact that very much more pure Coffee would be used were it put on the market, and hence new fields for its profitable cultivation are now and again suggested, offering fair inducements to capitalists. But it might, perhaps, be as well to make a note of old fields now only partially at work whose area might be vastly extended. Natal is one of these. At the last Colonial and Indian Exhibition, if we remember aright, some splendid examples of Cape Coffee, cured and uncured, were to be seen, and it was thought that this (then new industry) would prove a source of wealth to our friends below the Drakensborg. This promise, however, has not been carried into effect. Inquiring of a Government official (now in London) for the reason why, he delivered himself as follows:—"The reason Natal is not known as a Coffee-producing country is, that there is none available for export, the present production not being equal to local demands. Twenty years ago Coffee was exported to England, but since then errors in the methods of cultivation and other causes, have led to the industry being abandoned by the majority of planters. The habit of pruning the trees continually is supposed to have had a very pernicious effect on them. The Coffee which is produced, however, is fully equal in quality to plantations in Ceylon." It will be evident from this that there is little reason why Coffee should not soon become an article of export from this colony. As an informant says, there is plenty of labour to be had—plenty now on the spot, and the errors of early years need not be repeated to-day. One planter has now in fallow nearly 400 acres, left in this condition ever since the failure of the crop, after having yielded some £10,000 worth! Doubtless, the botanists now in the colony, if appealed to, could give all the necessary practical instructions, and caution; so that in time this old field could be rejuvenated, and inducements to placing adulterated parcels before the public considerably reduced.

Railway Rates.—A meeting of the Committee of the London Fruit, Flower, and Vegetable Buyers' Protection Association, Limited, and of Growers and Salesmen, was held on Thursday, 2nd inst., at the Mona Hotel, Henrietta Street, Covent Garden, at which it was resolved that a deputation, representing all the different interests of the fruit, flower, and vegetable trade, should be appointed to wait upon the President of the Board of Trade, together with the President of the Board of Agriculture, in relation to the above matter, and to invite the co-operation of all kindred Committees and Associations in the proposed deputation, in order that the same may be fully representative.

MARKETS.

COVENT GARDEN, February 2.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

TRADE improving, with prices generally better. *James Webber, Wholesale Apple Market.*

POTATOS.

The weather being more favourable, farmers are loading freely, and stock is increasing. Prices still continue firm. Best samples, 90*s.* to 100*s.*; ordinary kinds, 50*s.* to 55*s.* *J. B. Thomas.*

SEEDS.

LONDON: *Feb.* 1.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that for the time of year a fair business is passing in seeds. American cables come higher again this morning. Offers of English Clover seed are falling off. White and Trefoil keep steady. For Italian Rye-grass extreme prices are realised. There is no change in perennials. Spring Tares, with an improvement alike in value and demand, are getting in narrow compass. Of Sanfoin the supply is short. Canary seed is firm. Hemp seed on the spot appears almost unobtainable. Haricots are dearer abroad. Peas move off slowly. Rape seed is hardening. Mustard continues scarce and dear. Windsor Beans are much inquired for.

FRUITS AND VEGETABLES.

BOROUGH, *Jan.* 31.—Quotations:—Savoys, 3*s.* 6*d.* to 4*s.* 6*d.* per tally; Cauliflowers, 1*s.* 6*d.* per dozen; Sprouts, 1*s.* 6*d.* to 1*s.* 9*d.* per half-sieve; Turnip-tops, 3*s.* per bag; Carrots, 1*s.* 9*d.*; Turnips, 1*s.* 6*d.*; Parsley, 3*s.* per dozen bunches; English Onions, 8*s.* per cwt.; Dutch do., 6*s.* per bag; English Apples, 4*s.* to 6*s.* per bushel.

SPITALFIELDS: *Jan.* 31.—Prices remain as last quoted for nearly all sorts of produce.

STRATFORD, *Jan.* 31.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the prices shown below:—Savoys, 1*s.* 6*d.* to 6*s.* per tally; Greens, 9*d.* to 1*s.* 3*d.* per dozen; ditto, 2*s.* to 2*s.* 6*d.* per bunch; Brussels Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; do., 2*s.* to 2*s.* 6*d.* per sieve; Scotch Kale, 1*s.* to 1*s.* 3*d.* per half-sieve; Turnips, 2*s.* to 3*s.* per dozen bunches; do., 40*s.* to 50*s.* per ton; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle-feeding, 24*s.* to 36*s.* per ton; Parsnips, 8*d.* to 1*s.* per score; Mangolds, 17*s.* to 20*s.* per ton; Swedes, 18*s.* to 21*s.* per ton; Onions, English, 180*s.* to 200*s.* per ton; do., Bordeaux, 7*s.* to 7*s.* 6*d.* per case; Apples, English, 2*s.* to 2*s.* 6*d.* per bushel; do., American, 12*s.* to 21*s.* per barrel.

FARRINGDON: *Feb.* 2.—Quotations:—English Onions, 9*s.* per cwt.; Turnips, 45*s.* to 50*s.* per ton; Carrots, 50*s.* to 55*s.* do.; Parsnips, 60*s.* to 65*s.* do.; Swedes, 30*s.* to 35*s.* do.; American Baldwin Apples, 14*s.* to 16*s.* 6*d.*; Golden Russets, 22*s.* per barrel; Tomatos, 1*s.* 6*d.* to 1*s.* 9*d.* per box.

POTATOS.

BOROUGH: *Jan.* 31.—Quotations:—English Magnums, 50*s.* to 60*s.*; Hebrons, 60*s.*; Snowdrops, 60*s.* to 70*s.* per ton.

SPITALFIELDS: *Jan.* 31.—Quotations remain as for last week.

STRATFORD: *Jan.* 31.—Quotations:—Magnums, 50*s.* to 65*s.*; Imperators, 50*s.* to 65*s.*; Bruce Magnums, 65*s.* to 70*s.*; Scotch do., 60*s.* to 75*s.*; Main Crop, 80*s.* to 100*s.*; Belgian Magnums, 55*s.* to 65*s.* per ton.

FARRINGDON, *Feb.* 2.—Quotations:—Main Crop, 90*s.* to 100*s.*; Abundance, 90*s.* to 100*s.*; Magnums, English, 65*s.* to 70*s.*; Bruces, do., 65*s.* to 75*s.*; Hebrons, 75*s.* to 80*s.* per ton.

LONDON AVERAGES: *Feb.* 1.—Quotations:—Magnums, 50*s.* to 70*s.*; Hebrons, 60*s.* to 80*s.*; Snowdrops, 60*s.* to 80*s.*; Imperators, 55*s.* to 70*s.*; Champions, 50*s.* to 60*s.* per ton.

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (−) the Mean for the week ending January 28.	Accumulated. Above 42°, for the Week.	Accumulated. Below 42°, for the Week.	Accumulated. Above 42°, difference from Mean since January 1, 1893.	Accumulated. Below 42°, difference from Mean since January 1, 1893.	Rainfall. More (+) or less (−) than Mean for the Week.	Rainfall. No. of Rainy Days since Jan. 1, 1893.	Rainfall. Total Fall since Jan. 1, 1893.	Bright Sun. Percentage of possible Duration for the Week.	Bright Sun. Percentage of possible Duration since Jan. 1, 1893.

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E. 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending January 28, is furnished from the Meteorological Office:—

"The *weather* during this period was mild and humid, with generally clouded skies and occasional rain.

"The *temperature* exceeded the mean in all districts, the excess varying from 2° to 3° in most parts of the kingdom, to 4° in 'Scotland, E. and W.' The highest of the maxima were registered on the 23rd, and ranged from 53° in several of the English and Scotch districts and 'Ireland, S.,' to 50° in 'England, E.' The lowest of the minima were recorded, as a rule, towards the end of the week, when the thermometer fell to 24° in 'England, S.W.,' 25° in 'Scotland, N.,' and to between 26° and 32° in most other districts; in 'Scotland, W.,' however, the lowest reading was 34°, and in the 'Channel Islands,' 35°.

"The *rainfall* was rather more than the mean in 'Scotland, N.,' 'England, S.,' the 'Midland Counties,' and 'England, S.W.,' and just equal to it in 'Ireland, S.;' in all other districts there was a deficit. In 'England, N. and E.' the fall was very slight.

"The *bright sunshine* exceeded the mean at some of the stations in 'Scotland, N. and E.,' as well as in 'England, E.;' elsewhere there was a deficiency. The percentage of the possible duration ranged from 24 in 'England, E.' and the 'Channel Islands,' and 20 in 'England, S.W.,' to 9 in 'Scotland, N.'"

NOTICES TO CORRESPONDENTS.

TO OUR READERS.—*The Editor begs leave to solicit from the readers and contributors to the Gardeners' Chronicle:—*

Short Practical Notes on Cultural Matters;

Early Intelligence of Local News likely to be of general interest;

Notes and Memoranda useful to the trade;

Specimens of New or Interesting Plants, Fruits, &c.;

Drawings or Photographs of Gardens, Trees, Flowers, &c., and which if suitable for reproduction will be utilised so far as possible.

APPLE SHOOTS: *E. Tappin.* The shoots are attacked badly by canker, which is probably the result of your low wet situation. Some of them also appear injured by hard frost. To prevent canker, keep your ground drained as perfectly as possible, and be careful that the roots of the trees are not allowed to get into cold and wet subsoil.

BEETLE: *H. G. B.* The insect you send is the well-known black weevil, and is very destructive in the plant-houses. Spread a piece of calico on the ground beneath the plants, then by going into the house with a dark lantern, and suddenly turning the light in the direction of the plants, the insects will at once drop on the cloth. They must be speedily captured and destroyed. Hunt the potting-soil over for the small white grubs.

CATTLEYA FLY: *Cattleya labiata.* It is impossible for us to say who is in fault. You might have had the fly before you bought your plants. If you had no arrangement beforehand, we fear you must bear the loss.

CATTLEYA LABIATA ALBA: *C. D.* You may be right, but, in any case, it is of no interest to our readers.

ENTRY INTO THE SERVICES OF BOTANIC GARDENS: *Aspirant.* Application should be made in a regular way to the Director, W. T. Thiselton-Dyer, Esq., Kew; or to the Regius Keeper, Dr. Isaac Bayley Balfour, Botanic Garden, Edinburgh.

EUCHARIS MITE: *F. S.* Well, yes; we have never seen more upon one bulb than there were upon this one. We tremble for the cleanliness of our sanctum even, after this date. There is, perhaps, fungus also, but whether this is the cause or effect of mite has not yet been established.

FINOCHIO SEED: *A. J. S.* This seed is not kept by any of our seedsmen, so far as we know, but it may be obtained from MM. Vilmorin, Andrieux et Cie., 4, Quai Mégisserie, Paris; and MM. Damman & Co., à Teducio, Naples.

LAVENDER BLOOMS: *L. Vera.* We cannot recommend dealers; moreover, we do not believe that the flowers when sent will pay the cost of sending to Covent Garden. Better offer them to some perfumery distiller in Liverpool, or a maker of sachets.

MEALY-BUG ON VINES: *A. B.* Rub off the rough bark, and paint the rods with "Petroleum emulsion," or make a mixture of a wine-glass of petroleum to 3 gallons of hot-water and 1 lb. of soft-soap, mixing the soap in the water first. With this mixture the Vines may be syringed, if the application with a painter's brush takes up too much time. The interior of the vineries should be washed with strong soapy water, or the emulsion, once or twice, and the syringing of the Vines with the same till they expand their buds will check the increase of the bug after heat is applied to the vineries. Shovel out the upper layer of soil, replacing it with fresh materials. Use a camel's-hair pencil and methylated spirits whenever bug is observed during the rest of the year. More radical measures may be taken next winter to clear out the insect.

NAMES OF FRUITS: *G. Southcott.* 1, Rymer; 2, King of the Pippins; 3, Cox's Orange Pippin; 4, not received; 5, Hoary Morning.

NAMES OF PLANTS: *A. C. H.* A scrap of a Conifer, with the young foliage and male flowers; probably a Cupressus, but it is impossible to say which one. —*J. L. P.* 1, Phyllirea angustifolia; 2, Osmanthus aquifolius; 3, Photinia serrulata.—*W. R.* 4, the plant omitted in our last issue, is Corynocarpus lævigatus. — *J. B.* Next week. —*T. R.* Lælia anceps Sanderiana. The variegated Adiantum macrophyllum is a very pretty plant, and it should be very useful.—*H. J. R.* Your plant was imported from Brazil as Lælia Patini, but it seems to be only a form of Cattleya Skinnerii. In the flower you send the pollinia are wanting, and we cannot apply that test. The other is known in gardens as Burlingtonia granatensis, but it seems very near to Rodriguezia (Burlingtonia) refractra.—*J. S.* 1, Rodriguezia secunda; 2, Catasetum atratum.—*H. A. W.* Odontoglossum Lindleyanum.—*C. W.* 1, Probably Brachysema lanceolata; 2, next week; 3, Justicia chrysocoma.

NEW ZEALAND FLAX: *Hortus.* We should say that late autumn sowings made in sandy loam three quarters, and leaf-mould one-quarter, with a small quantity of sand if the loam be heavy, and keeping the seed-pans in a cool pit out of the reach of frost, and covered with a piece of tile or slate, would be the likeliest way of raising plants. The seed would remain below ground till January or February, unless the season should be very mild; and during that period light is not needed, and water in quantities only sufficient to keep the soil moderately moist. After germination there would be no harm in applying a higher degree of warmth than is afforded by a cold pit.

PARAGUAY TEA-MATE: *W. B. M.* Ilex paraguayensis. The taste is slightly bitter, and mucilaginous. We do not know where it may be bought in this country.

PAYMENT FOR LITERARY WORK: *X.* A matter of arrangement, in the absence of which the editor is not, in our opinion, bound to remunerate you, even if he has published your article. Formerly, only the regular members of the staff of a journal received payment. Now that journalism has become a business, most contributors expect to be, and are, paid for their contributions, with few exceptions, but this is by arrangement beforehand.

POISONING BY PRIMULA OBCONICA: *C. W.* Rest, cold lotions, cooling medicine, no stimulants. Consult your doctor.

WINTER-BERRYING CAPSICUMS: *Subscriber.* Obtain some cuttings of firm young wood in March or April, which strike in a mild hotbed. Pot the rooted cuttings without delay, grow them on close to the glass, at first in a warm frame, afterwards in a cool one, stopping the shoots from time to time till the end of July. After the last break, no glass protection is needed till October. Use loamy sandy soil, smallish pots, not much drainage, and feed if necessary with manure-water.

HOLLOWAY'S OINTMENT and PILLS.—Dangerous Chest Complaints.—The enumeration of these diseases is scarcely necessary, as, unfortunately, most Englishmen know them to their cost. Coughs, common colds, influenza, bronchitis, asthma, pleurisy, inflammation of the lungs, and even consumption in its early stages, are best treated by rubbing Holloway's Ointment upon the chest and upon the back between the shoulders. It penetrates internally, checks the cold shiverings, relieves the overgorged lungs, gradually removes the oppression from the chest, and restores the obstructed respiration, hitherto so distressingly disagreeable and highly dangerous. In treating this class of diseases, Holloway's Pills should always be taken while using his Ointment; they purify the blood, promote perspiration, and allay dangerous irritations.

THE NEW ANNUAL:

NEMESIA STRUMOSA SUTTONI.

COPYRIGHT S. & S.

THE FLOWER OF THE FUTURE.

"There can be no doubt but that the Nemesia will become one of the most popular annuals in cultivation, whilst its future cannot be foreseen in relation to ultimate development, as it has all the capacity for great improvement. A. D."—*Gardeners' Chronicle, September* 24, 1892.

THE SENSATION OF THE YEAR.

"Few annuals have created such widespread interest on their introduction as the handsome Nemesia strumosa Suttoni."—*Gardeners' Magazine, August* 13, 1892.

CANNOT FAIL TO PLEASE.

"This annual must soon become extremely popular. D."—*Journal of Horticulture, September* 22, 1892.

VERY BRILLIANT COLOURS.

"I have seen sixteen varieties of colour, all of them very brilliant and beautiful, and a bed of them mingled must be a very charming sight."—*Gardeners' Chronicle, September* 3, 1892.

MORE BEAUTIFUL AND LONGER-FLOWERING THAN THE ASTER.

"It has been flowering for more than four months past in the open ground with Messrs. Sutton and Sons, Reading, and is still flowering freely."—*Gardening World, October* 15, 1892.

A DISTINCT NOVELTY.

"This quite distinct and desirable novelty promises to be a valuable acquisition."—*The Garden, July* 30, 1892.

Awarded First-class Certificate by the Royal Horticultural Society on July 26, 1892.

Price of Seed, 2s. 6d. per Packet, Post-free.

Erselius, Redhill, to SELL by AUCTION, at their Rooms, 67 & 68, Cheapside, London, E.C., on FRIDAY NEXT, February 17, at half-past 12 o'Clock, 1000 ODONTOGLOSSUM CRISPUM, very fine healthy plants, and many large masses. Good varieties may be expected from them. Also 800 O. LUTEO-PURPUREUM.

On view morning of Sale, and Catalogues had.

Lea Bridge Road Nurseries, Leyton, E.
Near Hoe Street and Lea Bridge stations, G.E.R.
GREAT UNRESERVED SALE of superior NURSERY STOCK and 10,000 FRUIT TREES, the land being sold for building.
THREE DAYS SALE.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, as above, on WEDNESDAY, February 22, and TWO FOLLOWING DAYS, at 12 o'Clock each day, without reserve, by order of Mr. John Fraser, who is transferring the business to South Woodford, a large quantity of unusually well-grown NURSERY STOCK, all carefully prepared for removal, comprising 2000 Rhododendrons, best named sorts, a special feature at this Nursery; 2000 Hollies, including Golden Queen; 3000 Laurels, 1000 Pinus austriaca, 2000 Limes, 1000 Mountain Ash, 1000 Ivies, best sort; 750 Sweet-scented Clematis, hard climbers, in pots; 9000 Pyramid Pears, fruiting trees; 2500 Standard and Pyramid Apples and Pears, 1500 Plums and Cherries, 2000 Clove and other Carnations, in pots; 500 Herbaceous Calceolarias, strong fruiting and planting Vine Canes, Maréchal Niel Roses, for training; Tea-scented Roses, Hollyhocks, and other useful stock.

May be viewed any day prior to Sale. Catalogues had on Premises; and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone.

Begonias and Gladioli.—Special Notice.

MESSRS. PROTHEROE AND MORRIS beg to DRAW ATTENTION to the LARGE QUANTITIES of the above now being SOLD at THEIR ROOMS almost every day. The Bulbs are sent from some of the best Growers in the country, and comprise splendid strains.
Catalogues forwarded on application.

Wednesday Next.

5000 grand BULBS of LILIUM AURATUM and other LILIUMS from JAPAN; 50,000 LILY of the VALLEY, Crowns and Clumps; 1000 SPIRÆA, 1000 BEGONIAS, &c.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, February 15.
On view morning of Sale, and Catalogues had.

Wednesday Next.

500 Choice named Standard and Dwarf ROSES, Pyramid and Dwarf-trained FRUIT TREES; very fine Collection of BORDER PLANTS, well-grown GRAPE VINES, FLOWERING TREES, SHRUBS, &c., choice CARNATIONS and PINKS, PÆONIES, ANEMONES, and a consignment of BULBS from Holland.

MR. J. C. STEVENS will SELL the above by AUCTION at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, February 15, at half-past 12 o'Clock precisely.
On view morning of Sale, and Catalogues had.

EXCELLENT SITE for NURSERY!!—Eight-roomed House, Coach-house, Stable, and Shed, with about 3¼ acres of rich Garden Land (Freehold), in the favourite neighbourhood of Hampton, for Sale, on exceedingly favourable terms; or would be Leased.
Apply Mr. F. G. HUGHES, The Estate Office, Hampton-on-Thames.

FOR DISPOSAL, SUMMERHOW VINERIES, Kendal, consisting of about 20,000 feet of Glass, well stocked with Vines, Neil Roses, Maidenhair Ferns, &c. Suitable also for Tomato Culture. Heated with 3900 feet 4-inch Piping by two Boilers.
Particulars on application to owner, A. DUNCAN, Summerhow Vineries, Kendal.

To Nurserymen and Others.

FOR SALE, compact NURSERY PREMISES, comprising Residence, eight conveniently-arranged Greenhouses, Potting Sheds, Stores, and Gardens, well situate on main Road, close to improving Town, and where a lucrative Business has been carried on for many years.
Messrs. NEVE AND SON, Auctioneers, &c., Tonbridge.

NURSERY FOR SALE, near Blackheath, S.E., in Working Order.—Land, 442 feet by 150 feet (more or less), at low ground rent; contains seven Greenhouses, about 100 feet to 120 feet long, heated by three boilers. Three cold Frames, about 100 feet long; Planting Ground, &c. Stock at valuation if desired. Apply to—
THOMAS PEACOCK, Warwick Square, London, E.C.

St. Annes-on-the-Sea.

TO BE LET, ST. GEORGE'S GARDENS (the only Public Recreation Ground in the town), comprising about 7 Acres of Laid-out Grounds, with Ornamental Walks, Bridges, &c.; Tennis Lawns and Bowling Green; five large Vineries in good condition, Peach-houses, and Forcing-houses, &c. Possession March 1, 1893.
A considerable revenue may be derived from the letting-out of lawns, as well as from general garden produce.
St. Annes-on-the-Sea has a resident population of over 3000, and is now one of the most popular seaside health resorts in the North of England for the middle and upper classes.
For further particulars, apply to WILLIAM H. NUTTER, Secretary, Land Company, St. Annes-on-the-Sea.

Priory Nursery, Acton Lane, Middlesex.

TO BE LET, part of remaining Grounds, in portions, or as a whole (nearly 2½ acres), having about Eighteen large Greenhouses, in good working order, near to four railway stations, and London Markets. An uncommon opportunity to Tomato and Cucumber Growers, &c.
Apply, on the Premises, or of Mr. HORSNAIL, 95, Newgate Street, City, London.

TO LET, Immediately, through ill health, a genuine SEED, PLANT, and FLORIST'S BUSINESS, in growing market town, near London, main thoroughfare. Thorough investigation. Good opportunity for pushing man.—H. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO LET, a Small NURSERY.—Apply to E. BLAND, Primrose Nursery, Fordham, Cambs.

To Jobbing Gardeners.—Ealing, best part.

TO LET, on twenty-five years' lease, a four-roomed COTTAGE (ground floor), and three-quarters of an acre of splendid GROUND, recently a Nursery. No Glass.
BETA, Mewns, Stationer, Spring Bridge, Ealing.

TO LET, in Kent, 15 miles from London, small NURSERY, with three Houses, 100 feet long; 2 Acres of ground, rich soil. Apply, W. B., "Orange Tree," Wilmington.

FOR ORCHIDS and GARDENERS to Grow Them, apply to SANDER'S, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

FRUIT TREES.—Apples, Pears, Plums, Cherries, per 100 or 1000. Prices on application.
FLETCHER BROS., Ottershaw Nurseries, Chertsey.

20,000 PRIZE COB FILBERT TREES in full bearing. Apply to—

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSENGER & COMPANY, LOUGHBOROUGH.

FRANCIS RAVENSCROFT, Manager.

Greenhouses, Forcing-Houses, Vineries, Frames, &c.

HAWKINS' "PERFECTION," or DRY SYSTEM of GLAZING is the best. No skilled labour required to fix Glass or Paint, no Exit of Hot Air, no Drip, and much cheaper than any other. Sample double frame, 8 feet by 6 feet, with 2 Lights, painted 3 coats and glazed, for 45s. Note the marvellously low price for the following substantially constructed Houses—100 feet by 15 feet, £80; 60 feet by 15 feet, £60; 25 feet by 10 feet, £27. Several Second-hand Houses very cheap; 1000 extra strong lights, 6 feet by 4 feet, painted and glazed, £7 per dozen, worth double; less for large quantity. Do not build Glasshouses without first getting estimate (free) from

"HAWKINS," Horticultural Builder, Ashford, Middlesex.

"FRIGI DOMO" CANVAS.

Made of prepared Hair and Wool, a perfect protection to all Plants & Blooms. Cheaper than any kind of mat, and will last for years.

To be had from all Nurserymen and Seedsmen.

B.S. Williams & Son,

UPPER HOLLOWAY. LONDON, N.

WEBBS' CHOICE NEW PRIMULAS

WEBBS' NEW "FIREFLY."—Its dark, velvety crimson blooms are large in size, of good form and substance, and finely fringed.
2s. 6d. and 5s. per packet.

WEBBS' MODESTY.—The flowers on commencing to open are pure white, but when expanded they are of a delicate pink colour.
2s. 6d. and 5s. per packet.

WEBBS' SCARLET EMPEROR Flowers large, beautifully fringed, and of the brightest scarlet. 2s. 6d. and 5s. per packet.

WEBBS' PURITY.—A magnificent giant Primula; pure white; elegantly fringed, and of great substance.
2s. 6d. and 5s. per packet.

WEBBS' ROSY MORN.—Flowers of beautiful carmine-rose, large and finely fringed.
2s. 6d. and 5s. per packet.

WEBBS' EXQUISITE.—
White, 2s. 6d. and 5s. per packet.
Red, 2s. 6d. and 5s. per packet.
Mixed colours, 1s. 6d., 2s. 6d., and 5s. per packet.

WEBBS, WORDSLEY, STOURBRIDGE.

VEITCHS'

SUPERB

ONIONS.

THE BEST FOR EXHIBITION, TABLE USE, and PROFIT.

VEITCHS' MAIN CROP.

This is a most desirable and perfect strain for exhibition or table use. It is very quick in growth, and when fully developed attains a large size and heavy weight; the bulb is very smooth, clean-skinned, and of a beautiful pale straw colour. **Per Ounce, 1s. 6d.**

VEITCHS' SELECTED GLOBE.

A very handsome globe-shaped variety, selected and grown for several years at our Seed Farm, and now quite fixed in character. It is a heavy cropper and excellent keeper, and will form an excellent companion to our Main Crop, and prove to be one of the best Onions in cultivation.
Per Ounce, 1s 6d.

For full descriptions of the above, and many other CHOICE NOVELTIES and SPECIALTIES, see SEED CATALOGUE for 1893, forwarded gratis and post-free on application.

JAMES VEITCH & SONS

ROYAL EXOTIC NURSERY,

CHELSEA, LONDON, S.W.

THE BEST CARROT FOR FORCING.

SUTTON'S INIMITABLE FORCING.

The earliest Carrot in cultivation, and the most suitable variety for forcing. Roots small, globe-shaped, with clear skin. They make an elegant side dish, and the flavour is delicious.

"Your Inimitable Forcing Carrot is a great acquisition, coming to maturity quickly; and is of a most suitable size for the table."—Mr. A. G. FRAMPTON, *Gardener to* Mrs. Strachey.

"Your Forcing Carrot is the quickest and best I ever grew."—Mr. W. GURNEY, *Gardener to* J. P. Bryce, Esq.

Price of Seed, 1s. 6d. per ounce, post-free.

SATURDAY, FEBRUARY 11, 1893.

BARRIER ISLAND, N.Z.

THE New Zealand Government having decided to buy a small island called Hauturn, or Little Barrier, for the purpose of establishing a preserve for the native flora and fauna, the Commissioner of Crown Lands (Mr. Mueller) received instructions to proceed there, to try and arrange with the natives for the purchase of the island, and, having permission, I accompanied him to explore the land, take notes, and sketch. The island is about 40 miles from Auckland, and as there is no regular communication, we had to engage a small steamer to land us, and call again to take us off in a few days time. The landing is difficult, except in certain winds, as there is no harbour, and one has to land on the open beach, which consists of large round boulders, with no sand or shells of any sort. The land rises abruptly from the sea, and contains about 6900 acres, rising to a peak of about 2500 feet, with numerous spurs down to the sea, generally ending in cliffs of about 150 feet or more.

The island is nearly all dense mixed bush, and very hard to get about in, there being no tracks. On the mainland, cattle generally form rough tracks about the bush, in search of food, but as there are only a few bullocks on the island, which have only lately been landed for the purpose of dragging out the Kauri timber, they have as yet no opportunity of getting about. The first day was occupied in talking to the natives. The old chief Tenatalie—who is the principal owner, with his wife—is a fine old fellow, and has done a great deal towards preserving the birds on the island by not allowing anyone to introduce bees to the island. It is said by the Maories that the bees kill the bell-bird and other honey-eating birds; they either sting them on the tongue, or rob them of their food—any way, on the Great Barrier, where bees are kept; and on the mainland, the honey-eating birds are fast disappearing. Having ascertained which was the highest peak in the island, the next day we started to reach the top, and to do so we had to climb up the cliffs and get on the terrace above, and so on to the leading spur. On the cliff above we found a dense growth of Manuka scrub growing on poor clay land, which once cleared of Manuka (Leptospermum scoparium), I very much doubt if it would grow grass, as it gets so dry and burnt up in summer.

Amongst this Manuka we noticed several pieces of the valuable Kauri Gum, and from the inquiries we made from the natives, we were informed that they are able to get about 1*s.* a pound for it in Auckland; there seems to be a great quantity of it all over the island, so the Kauri must have covered the island some hundreds of years ago, as it is found at a depth of 3 to 6 feet, or even deeper. After leaving the scrub, we got on the main spur

all dense mixed bush, the principal trees being the Kauri (Agathis australis), Rata (Metrosideros robusta), Puriri (Vitex littoralis), and the Taraire (Beilschmiedia Tarairi), the latter being a handsome laurel with a sort of purple Plum on it, but the wood is only good for firewood, as it is very brittle, and not durable. At the entrance to the bush the Nikan Palm grows better than I have ever seen it on the mainland. The loose rocks and stones make it very hard climbing, and the dense growth of small Ferns covering the ground with the wet moss increase the chances of a sprained foot, but make it just the home for the wingless birds. By steady climbing we reached the summit, which is still bush, though stunted, with an undergrowth of Mountain Flax. A view could be got here through the trees of the mainland and the islands in the Hauraki gulf. The Great Barrier seemed close by, although 12 miles distant. Sketches were obtained, and we started down the hill. There is a tree growing near the summit that I do not think is common on the mainland — a white Rata, the usual colour being red. The descent was easy, and the result of our climb and observations generally were, that no island could be better adapted for the purpose that the Government proposed to buy it for, as it was covered with bush and undergrowth that the birds could get their natural food in, and also difficult of access to man. I may mention that the bush teems with bell-birds, which are nearly extinct on the mainland, and for their sake alone the island should be closed to anybody without permission from the Government to visit it. The stitch-bird is still in existence on this island, which is also very rare indeed. Kiwis are also there, and if preserved will increase, but the dog must be prohibited first, as it is its greatest enemy, and I know that a white settler on the island occasionally gets them, or his dog does; of course, that will be stopped once the Government obtains possession. To obtain the island as a reserve was the object of our late Governor, Lord Onslow, whose recommendation and that of the Ministers, that it ought to be done, would be sufficient guarantee to the public that it will be bought if possible. The island at one time must have been a great native stronghold, as I saw numerous evidences of past occupation by natives; for instance, old stone pahs on the beach, with large ones on the hills, to retreat when they saw their enemies coming in canoes from the mainland. The hill pahs have Kumera-pits, showing they kept their food supply there (Kumera is the sweet Potato).

The spur up one of the cliffs to the pah above has been razor-backed by them, so that only one at a time can get up it, and must have been well defended. No old curios belonging to past generations of Maoris have been found on the island except a stone "mere;" although stone adzes must be there in plenty covered with vegetation. The few natives seem to know very little about the island, although I questioned them closely; and I fancy since Europeans have come to the country, it must have been only visited occasionally by them for fishing and collecting young mutton-birds, a sea-bird that builds in holes on the cliffs, which the Maoris preserve in their own fat; they taste well, something like the smell of a blown-out oil lamp. I doubt if the bush is wet enough and with sufficient undergrowth for the South Island wingless birds; anyway, it will not be required for them, as the Government have reserved a splendid island for the purpose near the West Coast Sound, far from the haunts of man and picnic parties. There is one wingless bird that must be left out, and that is the weka or wood-hen, as they eat every egg they can find, there are none on the island at present. The rare Tecatara lizard lives also on the island, it is the first time that I have seen their eggs, which are white, and when shown to me I thought were eggs of a small sort of turtle. The Pupurangi, the only New Zealand snail, is also found there; it lays eggs just about the size of an English wren's egg, white in colour, with a hard shell, and in the ones I have cracked found a small complete snail shell inside—they are rare now. The shell is of a dark green colour, a pretty light blue inside, with a wonderful natural polish. I kept one a long time in my garden, but it was unfortunately killed by being left in the sun. On the flats near the sea a beautiful fine variety of Maidenhair Fern grows in great quantities; and the now rare edible Fern is found in one place on this island, and from its proximity to the old Maori cultivation I should say that it had been brought from the mainland. There is a small sort of green Orchid that grows on the trees there that has a most delicious scent; it is common, but I forget the name. There are no minerals as far as I could see on the island, although on the Great Barrier close by gold, silver, copper, and other minerals are found. If there had been any quartz in the gullies it would have been an indication that gold might be found, but we found nothing but sandstone. I awoke at about half-past four in the morning, and listened to the song of the birds, especially the bell-bird. It is alone worth a trip to this lovely country, but visitors must not expect to hear them for any time. The general chorus lasts about half-an-hour, then all is silent, except broken from time to time by the note of the tui or parson-bird. Later in the day in the bush the bell-bird again can be heard in ones and twos, but the morning is the time; the gladness and freedom of their song in the first half-hour of daylight cannot be described. Will the European birds oust the beautiful native birds? is the question. I am afraid so; as the white man has the natives. Blown by the wind from the mainland, numerous blackbirds, thrushes, goldfinches, sparrows, and quails have taken up their abode on the island, but as they keep to the edges of the bush and flats, they do no harm, and the place will be alive with the pugnacious little quail in a few years—nothing to disturb them. December is the time to see the island, the cliffs one mass of scarlet Polintakawa, or the Christmas-tree of the white people; it is a sort of Rata, only more beautiful; the scarlet against the green, with the dark bush rising to a peak behind, is a picture impossible to paint, or even give the faintest idea of. *Hugh Boscawen. Auckland, N.Z.*

New or Noteworthy Plants.

CYPRIPEDIUM DIBDIN (ARGUS × BOXALLI).

With a somewhat close resemblance to some of the forms of C. vernixium (Argus × villosum) the above variety is sufficiently distinct to be easily recognised, especially noticeable being the purple marking and spotting of the upper sepal extending over its whole surface, with the exception of the narrow blush-white margin. The whole flower has the varnished surface of C. vernixium ×, and the petals have blackish spots on the inner half, similar to those observed in that variety. The upper sepal is green, profusely striped, and spotted with dark purple, and having a narrow blush-white margin; the lower sepal is pale green, with darker green veins, and a few brown stripes; the petals whitish, tinged on the upper halves with rose-colour, and spotted with blackish-brown; the lip is of greenish-white, tinged with rose on the face; the staminode is yellow, with green reticulations in the centre. It was raised by Mr. J. C. Cowley, the raiser of the beautiful C. Cowleyanum ×, in the gardens of F. G. Tautz, Esq., Hanger Hill, Ealing. *James O'Brien.*

Velleia Salmoniana.

To commemorate the tercentenary of Trinity College, Dublin, and in honour of the Provost, the Rev. Dr. George Salmon, Baron von Mueller has named this new Goodeniad.

It was found near the Gascoyne River, and is superficially like Goodenia filiformis, but presents many botanical differences. A full description of the plant is given by the Baron in the *Victorian Naturalist* for December, 1892. We understand that seeds have been sent to the Botanic Garden of Trinity College, so that in due time we hope, by the courtesy of Professor Perceval Wright and Mr. Burbidge, to refer again to the plant *de visu*.

Brugmansia aurea.*

A small tree, with leaves like those of D. arborea, flowering in winter, and producing golden-yellow flowers. Professor Lagerheim says it comes near to D. arborea and to D. cornigera, but is quite distinct from either. It is a native of Ecuador.

Cattleya Alexandræ.†

A species allied to C. Leopoldi, and remarkable amongst other things for the long flower-stalks, which lift the flower-racemes high above the foliage. The sepals and petals are remarkably undulate, some of the colour of Lælia elegans Turneri, others like those of L. grandis tenebrosa. The two plates given in the current number of *Lindenia* of var. tenebrosa and of var. elegans bear out this statement. Mr. Rolfe calls attention to the important results likely to accrue from hybridisation in this case.

Odontoglossum Insleayi var. Imschootiana.‡

A fine variety, with flower-segments self-coloured orange-yellow; the lip paler, canary-yellow, with a double row of brownish blotches within the margin.

Cypripedium Leonæ §

Of this fine hybrid, the standard or dorsal sepal is boldly ovate, white, traversed for about three-fourths of its length with lilac stripes, and marked for half its extent with numerous purple spots on a green ground. The petals are oblong, undulate, broader towards the free end, and purplish except at the tips, which are white; lip of the same colour.

It is dedicated to Mrs. Leon of Bletchley Park, and is figured in the *Lindenia*, t. 360.

Cypripedium murillo, *new hyb.*

This is a hybrid raised by Charles Vuylsteke, nurseryman, Loochristy, near Ghent, from C. Boxalli atratum by the pollen of C. Argus, which it much resembles. The ground-colour of the dorsal sepal is sea-green, much spotted with shining black at the base; the upper part of a dark green colour, with a wide creamy-white border; the inferior sepal is very long, greenish-white, with bands of clear green dotted with sepia. Petals horizontal, gracefully curved, brownish claret-coloured above, much dotted with dark chestnut, with jet-black hairs; the lower part has a ground-colour of greenish-white, streaked with dark green, and spotted with reddish-chestnut; the lip is long, blood-red on the upper surface, olive-green with a rosy-flush below. Staminode flesh coloured, under-surface of the lobes olive, in the centre an excrescence of brilliant green; floral scape about 15 inches high, dark brown; bract green, dotted with black at the base. The foliage is fine, nearly 2 inches wide by 9⅓ inches long, with very serried hieroglyphic markings. It flowered first in December, 1892. It is a sturdy hybrid, and of good habit. *F. Desbois, Ghent.*

Clerodendron hastatum,

A coloured figure of which is given in the last number of the *Revue Horticole*, February 1, is a scandent shrub, with ovate-lanceolate, hastate, somewhat three-lobed leaves, green with a purplish blotch in the centre. The flowers are borne in large terminal clusters; each has a purplish bell-shaped calyx half an inch long of five lanceolate segments, free nearly to the base. The white corolla has a very slender curved tube, 3 to 4 inches long, expanding into an irregularly five-lobed limb, the five segments of which are rolled back. The stamens project beyond the corolla, and are of a purplish

* *Brugmansia aurea*, Lagerheim, in *Gartenflora*, January 15, 1893, p. 33.

† *Cattleya Alexandræ*, Linden and Rolfe, in *Gard. Chron.*, 1892, vol. i., p. 523; var. tenebrosa, *Lindenia*, t. 357; var. elegans, *Lindenia*, t. 358.

‡ *Odontoglossum Insleayi var. Imschootiana*, *Lindenia*, t. 359.

§ *Cypripedium (hybridum) Leonæ*, *Lindenia*, t. 360. Hybridum inter C. insigne var. Chantini et C. callosum arte confectum.

colour. It was originally described by Lindley in the *Botanical Register*, t. 1307, and was subsequently figured by Hooker in the *Botanical Magazine*, t. 3398. In the *Flora of British India*, vol. iv. (1885), p. 596, the plant is described by Mr. C. B. Clarke, and the native country stated to be Silhet and the Khasia Mountains, where it was collected up to an elevation of 3000 feet by Hooker and Thomson. It should be cultivated in the same manner as other stove Clerodendrons.

Two New Begonias.

Begonia Baumanni.—This beautiful tuberous Begonia was introduced by Dr. Sacc from Cochabamba (Bolivia), who sent seed of it to M. E. N. Baumann of Bollwiller. Dr. Sacc, in the *Revue Horticole*, 1886, speaks of finding it in abundance in the damp valleys of the northern Cordilleras. It attains to a great size; the flower is very bright rose-coloured, the leaves are large, fleshy, and dark green. The flowers have a slight and agreeable perfume. The males are the larger, at the top of the stalks, usually in the proportion of two to every female flower. The plant seems eminently suitable for decorative purposes both in and out of doors. It may be mentioned that this Begonia, according to Dr. Sacc, produces in its native habitat tubers as large as a medium-sized Melon, and weighing generally about 13¼ oz. av. (375 grammes). The stems are thick and short, so that the flowers appear to be radical; the blooms are symmetrical, rounded, and kidney-shaped. The floral clusters often number as many as five-and-twenty on one plant at the same time; they are red, thick, rigid, and absolutely vertical; each bears from three to six flowers, which open about 15½ to 19½ inches above the foliage. The male flowers, which appear first, have four spreading petals; the two lateral ones are most developed, and measure from 3½ to 4¼ inches across. They are of a beautiful clear rose colour, and have a perfume like that of a Tea Rose. Begonia Baumanni should be grown in full summer sunshine; under these conditions, its peduncles, though laden with bloom, remain erect, and are not bent down by rough weather.

Begonia fulgens.—This species was found near to B. Baumanni in the mountainous regions of Bolivia, near the Peruvian frontier, not far from where B. Davisi grows plentifully; it is a tuberous species, with small, orbicular-oblique leaves, which are glaucous-green, and in the young state covered with little rosy hairs, which give them a velvety appearance. The stems which bear them are so short as to appear radical, and form a low and close tuft, whence rise a great number of straight flower-stems. These floral peduncles, of a bronze-red colour, bear each from five to ten erect flowers, which open about 7¾ inches above the foliage. The male flowers measure about 2¾ to 3¼ inches, have four rounded, well-expanded petals, brilliant raspberry-red, deeped at the edges; the female flowers are as numerous and beautiful as the male, and formed of five or six petals. They exhale a slight Tea Rose-like perfume in the morning. The species is very free-flowering; the plant as it grows forms broad tufts, from which rise an ever-increasing number of erect flower-stalks. The plant requires exposure to full sun all the summer, and, until the frost, it forms masses of bright red colour, which are most effective.

[Both the above species are catalogued by MM. V. Lemoine et Fils, of Nancy.]

Orchid Notes and Gleanings.

ODONTOGLOSSUM EDWARDII.

Mention should be made of a magnificent example of the above fine species of Odontoglossum at present in bloom at Eastwood Park, near Glasgow, the residence of D. Tod, Esq. It has six handsome, many-branched spikes, carrying in all 1180 flowers, of a warm purplish-mauve; the bulbs are of immense size, measuring 8 inches high and 4 inches across —one pseudobulb having produced three spikes. *D.*

Variability of Hybrid Cypripediums.

Two flowers, obtained from plants raised from seeds contained in the same capsule (Dauthieri × Spicerianum), borne on plants raised by Mr. H. Simpkins in the gardens of R. I. Measures, Esq., Cambridge Lodge, Camberwell, S.E., give singular evidence of the extraordinary range of variety to be obtained, not only from seedling Cypripediums of the same parentage, but from seeds actually contained in the same seed-vessel. The one flower has the white upper sepal with a broad purple band up the middle, and clear purple rays on each side; the staminode is purple, and the whole flower spotted, striped, and tinged with purplish-brown. The other flower is almost entirely of a pale green, except the upper half of the dorsal sepal, and a narrow line half-way up its centre; there is a slight rose tint on the staminode, and on the petals and lip an almost imperceptible tinge of lilac. Both varieties are pretty, and had they been of different parentage, they could hardly have been more distinct. *J. O'B.*

KEW NOTES.

Rosa gigantea.—This plant has succumbed to the severe frosts recently experienced, all the plants grown against walls in the open-air at Kew having been killed outright. Two of these were grafted on seedling Briars, and one, a large plant with a stem nearly 2 inches in diameter, was on its own roots. From this it would appear that this interesting Rose is of little value for English gardens, except perhaps in Cornwall, the Isle of Wight, and the south coast generally. Mr. Hanbury obtained a plant of this species from Kew two years ago for trial in his garden on the Riviera, where most likely it will be more at home than in this country. Rosa berberifolia does not show the least signs of injury this winter, although it has had no more protection than that afforded by the south wall of a plant-house. This is its second winter outside at Kew.

LILY CULTURE IN POTS.

A considerable number of species and varieties of Lilies are well adapted for this kind of culture, and the plants when well grown and flowered have an excellent effect in greenhouse or conservatory. Indeed, those who would see the finer species and varieties of Lilies in full beauty should grow them under glass, not that they require the aid of glass through all the periods of their growth; but they need it when in flower, and immediately afterwards, to perfectly mature the bulbs. Mr. H. J. Elwes, writing on Lily culture in his *Monograph of the Genus Lilium*, recommends the Lily bulbs to be planted in a prepared bed, in a house specially built for them, and the lights made to draw off, or arranged in some way that the plants would be exposed to the weather if it was thought desirable at any time. Mr. Elwes would have a bed of prepared soil, 2 feet deep, over 9 or 10 inches of drainage. Part of the bed would be formed of a compost from which peat is excluded, and the other part of it would be half of peat, and a quarter of leaf-mould; loam and sand, with the addition of charcoal, being used where needed. A part of the house should also be set aside to contain a bed built of brick, in which to plunge Lilies in pots. "All newly-imported bulbs should be planted in small flower-pots," says Mr. Elwes. "However large a bulb may be, and whatever depth of soil it may require when established, it is always good policy to start it in a small pot, and either shift it to a large one, or plant it out when well rooted." I do not intend the following remarks on culture for such growers as Mr. Elwes, Mr. G. F. Wilson, or other famous cultivators, who have had more experience than I have; but questions are frequently asked about Lilies, and failures are so frequently met with, especially when grown in pots, that as I have found no difficulty with them, my successful experience may be helpful to many readers of the *Gardeners' Chronicle*.

The most useful of all Lilies for culture in pots is L. auratum, and perhaps the trade would say this is the only Lily they can deal with at a profit. A successful trade grower would remark upon certain beautiful species or varieties, that they were very pretty, but were of no use, as there was no money in them. L. auratum is sold cheaply enough now, and is within the reach of everybody; but I can well remember when we had to pay a guinea for small bulbs, and three guineas for large ones. Fifty or one hundred bulbs can now be obtained for that money.

Some persons have a fixed belief that L. auratum degenerates when cultivated year after year in pots. It may do so under bad cultivation, but under other conditions it improves year after year. The first year they must not be over-potted; this is a grave error. Small bulbs may be planted in pots 4 or 5 inches in diameter (inside measurement), medium-sized bulbs in 6-inch, and the larger ones in 7-inch. The soil I use is a good yellow loam two parts, with an addition of one part fibrous peat. Leaf-mould is not necessary, but it may be used if peat cannot be obtained. Drain the pots well, and plant the bulb in the centre of each moderately firm, a little clean coarse sand to be placed under and over each bulb. The crown of the bulb should be half-an-inch at least under the soil, and the pots should not be filled up to the top by about 1 inch. I find I have omitted to mention that some decayed manure should be added to the compost, and coarse white sand if necessary. When the plants are potted, plunge them in cocoa-nut fibre refuse in frames well over the rims; if the potting compost was moderately rich at the time of using it, no water will be needed until the plants show through the fibre. If the soil in which they are growing then seems to be very dry, give them a good supply of water. It is before the plants arrive at this stage that much mischief is done by inexperienced cultivators. Instead of plunging the newly-potted plants as I have advised, they are placed on the stage in the greenhouse, where the soil soon gets dry upon the surface, and water is applied freely before any roots are formed, and the result is, that the bulbs rot at the base more or less, and do not start to grow at all, or but very weakly. I have also seen the bulbs after being repotted plunged or placed under the stage of the greenhouse, where some of the poor bulbs become saturated with the constant drip from above, and those not under a drip may even suffer from dryness. The only sure way to success lies in starting the bulbs as I have recommended. The cocoa-nut fibre retains the moisture in the soil without increasing it, and the bulbs are also maintained in a uniform low temperature, so that the roots are formed before any top-growth is made. This is the way in which all bulbs should be started that are intended for greenhouse culture. Encourage the roots to make good healthy growth before the flower-stems show from the crowns.

Another important point is the repotting. The best time to repot bulbs of this kind is just before they begin to make roots. Lilies are different from the bulbs of Hyacinths, Tulips, Crocuses, &c., in that the roots from the base of the bulbs are always in a plump, sound condition; it is only the roots that issue from the base of the stems that die annually with the stems. Referring again to the bulbs which were starting into growth in the frames, as soon as the stem shows through the fibre, this should be removed with the fingers, leaving the rims of the pots exposed. Admit air freely, removing the lights in fine weather, but closing them at night, and when frost obtains. When the plants have grown so much that they come into contact with the glass, remove them to a light part of the greenhouse, where they may get plenty of air. Abundance of air and light is necessary to keep them in sturdy health. After a time, roots will form at the base of the stems very freely, and as I advised, filling the pots only to within 1 inch of the surface, and the soil would subside about half an inch more; this space may now be filled in with some rich dressing. This should consist of about equal portions of decayed manure and

good fibrous yellow loam. The stem-roots push freely into this, and form a perfect mat. When the flowering period is over, and the stems show signs of decay, reduce the water supply considerably, and do not commit the error of putting them out-of-doors to be saturated with the autumn rains. They flower at different periods between June and October, and cannot be all potted at one time. At the time of repotting turn the plant out, and with a gentle twist of the stem screw it out from the crown of the bulb. Repot the bulb again in a larger pot without disturbing the useful roots which have been produced from the base of the bulb. The above treatment applies specially to Lilium auratum, and as this is the season of the year in which the bulbs are being received, the instructions as to culture may be opportune. Nearly all Lilies grown under glass may be treated as I have advised. L. lancifolium is next to L. auratum in usefulness, and the variety amongst them is very charming. The slender-growing L. tenuifolium is easily managed, and for pot culture the best varieties of L. tigrinum are very effective, such as the double-flowered variety spendens and Fortunei. L. Hansonii is also a distinct and stately species. *J. Douglas, Great Gearies, Ilford.*

A SYNOPSIS OF THE SPECIES OF CANNA.

(*Continued from p.* 70.)

Sub-genus I. Eucanna; corolla-lobes and staminodia united in a short tube at the base, two or three of the upper staminodia being developed.

Group 2. *Upper staminodia usually two.*

12. C. compacta, Rosc., *Scit.*, t. 22. Stem stout, green, glabrous. Leaves broad oblong, acute, green, the lower above 1 foot long. Inflorescence a dense many-flowered simple raceme. Sepals lanceolate, ½ inch long. Petals lanceolate, unequal, reddish-yellow, 1½ inch long. Upper staminodia two, oblanceolate, bright crimson, slightly emarginate, 1½ to 2 inches long, ¼ inch broad; lip red-yellow, distinctly emarginate.

Hab.—Tropical America. Introduced into cultivation in 1820.

13. C. lutea, Miller, *Gard. Dict.*, edit. viii. (1768), No. 4; Rosc., *Scit.*, t. 18. Stems slender, green, glabrous, 3 to 4 feet long. Leaves green, oblong, acute, about 1 foot long by 5 to 6 inches broad at the middle. Inflorescence a lax simple or forked raceme; bracts small, oblong, obtuse, green. Sepals oblong, greenish, ⅓ inch long. Petals lanceolate, pale green, 1 to 1¼ inch long. Upper staminodia two, oblanceolate, pale yellow, often emarginate, 1½ to 2 inches long, ¼ inch broad; lip linear, pale yellow, unspotted, distinctly emarginate. Capsule globose, small.

Var. C. pallida, Rosc., *Scit.*, t. 19. Upper staminodia and lip pale yellow, spotted with red.

Var. C. aurantiaca, Rosc., *Scit.*, t. 21. *C. Tinei*, Todaro. Petals tinged with red. Upper staminodia and lip bright reddish-yellow, the latter spotted with red.

Hab.—Tropical America, especially West Indies and Brazil. Here belong *C. lagunensis*, Lindl., *Bot. Reg.*, t. 1301; *C. crocea*, Lag.; *C. maculata*, Link; *C. commutata, leucocarpa, Moritziana*, and *Roscoeana*, Bouché; and *C. macrocarpa, sulphurea* and *vitellina* of Horaninow.

14. C. variabilis, Willd., *Enum. Berol.*, 4. *C. carnea*, Rosc., *Scit.*, t. 15. Stem green, 3 to 4 feet long. Leaves oblong, acute, green, the lower 1 foot long. Inflorescence a lax simple raceme; bracts small, oblong, obtuse. Sepals green, lanceolate, ⅓ inch long. Petals lanceolate, pale green, 1½ inch long. Upper staminodia two, oblanceolate, pale red, entire; lip linear, entire. Capsule globose, small.

Hab.—Sent from Rio Janeiro to Roscoe by Mrs. Harrison.

15. C. lanuginosa, Rosc., *Scit.*, t. 16. *C. achiras*, Gillies; Lindl., in *Bot. Reg.*, t. 1358. Stem green, woolly-pubescent, 4 to 6 feet long. Leaves oblong, acute, green, the lower 1½ foot long. Racemes lax, few-flowered, simple or forked; bracts obtuse, small, green. Sepals lanceolate, green, ⅓ to ½ inch long. Petals lanceolate, tinged with red, 1½ inch long. Upper staminodia two, oblanceolate, entire, red or reddish-yellow; lip the same colour, oblanceolate, emarginate.

Hab.—Introduced into cultivation from Maranham, North Brazil, in 1823 by Mr. R. Hesketh and by Gillies from Mendoza. The only specimen I have seen is one from the Berlin garden in the British Museum.

16. C. Warscewiczii, Dietr., in *Allg. Gartenzeit.*, xix., 290, with figure; Seem., in *Bot. Mag.*, t. 4854. Stem claret-purple, pruinose, glabrous, 3 to 4 feet long. Leaves oblong, acute, more or less tinged with claret-brown, 1 to 1½ foot long. Raceme simple, moderately dense; bracts ovate, claret-brown, very glaucous; lower flowers in pairs. Sepals oblong-lanceolate, glaucous, ½ inch long. Petals lanceolate, tinged with red, glaucous, 2 inches long. Upper staminodia two to three, oblanceolate, bright scarlet, entire, or obscurely emarginate, 2½ to 3 inches long, ½ inch broad; lip oblanceolate, distinctly emarginate, plain bright scarlet. Capsule larger than in *C. indica*.

Hab.—Costa Rica. Introduced into cultivation by Von Warscewicz in 1849. *J. G. Baker.*

(*To be continued.*)

EVERGREENS IN POTS.

We very seldom see these plants used to full advantage, yet there are great numbers of evergreens of dwarf growth, distinct in habit, foliage, and hue, that are well suited for pot-work. At the present season many of the glasshouses are rather dull, and a few of the brightest of our compact-growing Conifers will make the cooler houses look gay and seasonable. Then there are window-boxes, looking very desolate and forlorn; the more so, because most other surroundings are also dull at present. Beds and borders, too, that are used for spring and summer bedding, may be made gay and pleasing all the winter and early spring by a small collection of evergreen and variegated shrubs. The practice of using such beds for bulbs comes very expensive if they are to be filled sufficiently to make a good show; while the beds themselves are void of all beauty for a long period.

If shrubs are used, the first expense is the last. A selection of the grand varieties I name below will afford quite a variety of golden and silver colour, many shades and shapes being found among them. It is also so easy to arrange a bed to your own satisfaction, as the plants may be depended upon to retain their respective heights, &c., whereas no planting of spring-flowering stuff, like Polyanthuses, Forget-me-nots, Wallflowers, &c., nor bulbs, can be relied upon so securely.

An excellent guide for compost most suitable for each kind is to get a mixture as nearly as possible like that the young plants have been growing in when purchased from the nursery, although all shrubs will do well in any ordinary garden soil. When the beds are wanted for spring and summer blooming plants, it only remains to lift the shrubs and replunge them in some convenient corner until required to do duty in the same way again. If properly attended to as regards water, and a very slight use of the knife, most of those I name will last for many years. Window-boxes, too, can be kept gay all the year round by the same means, and there is never a blank, or loss of a slight natural screen, by adopting this plan. Cold will not affect them; nor will dust and draughts injure them when standing in a hall or room. In this respect they are very valuable, and only need a good syringing now and again to keep them healthy and bright. By ringing the changes upon a few plants, they may always have a fresh appearance. If the boxes and beds have a little Cocoa-nut fibre refuse in them, the pots can be plunged easily, and will be secured from excessive drought and frosts.

Thuia aurea, T. Ellwangeriana, T. semper aurescens, T. Vervaeneana, T. ericoides, Chamæcyparis variegata, Cryptomeria elegans, Cupressus Lawsoniana C. L. lutea, C. L. erecta viridis, C. L. Fraseri, C. L. argentea, Juniperus chinensis, J. virginiana, Pinus cembra, Abies Lowii, Retinospora ericoides, R. leptoclada, R. obtusa nana, R. o. filifera, R. plumosa, R. p. aurea, R. p. flavescens, R. squarrosa, Taxus aurea, T. fastigiata (Irish Yew), T. f. aurea, Thuiopsis borealis (syn. Cupressus Nutkænsis), T. dolabrata, Arbutuses, Aucuba japonica, Box in variety, Euonymus in variety, Laurustinus, Hollies of sorts, Osmanthus ilicifolius variegatus, and in short many more shrubs are all worthy of growing in the connection pointed out above. *A. P.*

BEAUDESERT.

Although Beaudesert, the castle of Cannock Chase, is not now inhabited, and the grounds are neglected, yet it still retains a great measure of its former grandeur. This is chiefly owing to its commanding position near the summit of a high ridge, at a place where a deep ravine separates it from a wood of tall trees. The flower gardens are on the side of the castle, facing the slope of a grassy ridge, and consist of three quadrangles, with low balustraded walls round them. In the centre of each is a circular basin of stone, in which a fountain plays, and on the walls are brazen urns for holding flowering plants. The flower beds are in the shape of segments of arcs, and make circuits round the fountain. It is very precise, of course, but, all the same, seems to harmonise with the formal architecture of the house. A wide lawn ascends to thick shrubberies, and on the left a path by a sunken wall conducts to a row of ancient Spanish Chestnuts, which must have been there some time before the castle was built.

The park has many distinguishing characteristics. This, of course, is owing to its being situated in the centre of Cannock Chase. High ridges and deep valleys, Scotice heughs alternate, and large tracts support only Gorse and Heather, and look like a solitary heath. As the hills are covered with woods, and the grass land is abundantly timbered, the views are very picturesque. A walk along the ridge on which the castle is built, leads to the highest point on the Chase, 700 feet, which commands an outlook over all the country-side. The wild rugged beauty of Cannock can here be well studied, while the bracing air has an invigorating effect on the man in city pent. This Castle Hill, as it is called, is a great theme for dispute to antiquarians. Round its circular flattened top, 270 yards in diameter, has been constructed a vast rampart, with a *fossé* at its foot. It has evidently been either a Danish or Roman camp. Pennant even thinks it may have been ancient British, but the proximity of Canke (Canute's) wood seems to favour the theory that it was constructed by the Danes.

Cannock was originally a royal hunting place, and Beaudesert was the site of a famous monastery; at the dissolution it was given to Sir William Paget. Few men, as a glance at Froude will show, have played a more prominent part in English statecraft. He was ambassador at Paris all the time that Francis I. and the Emperor Charles V. were intriguing for Henry VIII.'s support. His pithy letters to his master are published in the "State Papers," and are an epitome not only of the meshes of French diplomacy of that time, but also of social life of the period. They also show his bluff honesty and pertinacity. He with Hertford, afterwards the Protector, were the only two present when Henry VIII. gave his dying injunctions. He supported Somerset loyally, even to the time of his impeachment. Although, as can be seen from his letters to him preserved in the Lansdown MSS., he frequently warned him. For this devotion to his friend, he lost Beaudesert, but it was restored to him by Mary, to whom he was one of the first to attach himself. As he supported her marriage with Philip, he become one of her most trusted advisers. There are but few mementos in the castle of this first Lord Paget of Beaudesert, except a fine portrait by Holbein. This

is not the case, however, with his brave descendant, the first Marquis of Anglesea. Every room contains some relic of this brave soldier, who covered himself with glory at Waterloo. It is a pity that such a fine old historic place should be left untenanted. The old folk of Paget's Bromley remember when a baron of beef was roasted at Christmas, and there was a welcome for all of them. Let us hope there are better times coming; it would not, perhaps, be wise to wish the old times back. *Vagabond.*

THE VIOLA AS A DECORATIVE PLANT.

I am frequently asked the question, "Who was it that brought the Viola into notice for bedding purposes?" A few words in your columns in reply, may not be out of place. It was in the year 1862, when Mr. John Wills, now florist at South Kensington, was head gardener to Sir Philip de Grey Egerton, Bart., Oulton Park, Tarporley, Cheshire, that on the occasion of a visit to the Wellington Road Nurseries, London, he saw six plants in bloom of Viola cornuta amongst Messrs. E. G. Henderson & Sons' collection of herbaceous and alpine plants, and was so much struck with its colour and appearance that he wished to purchase the lot; but as the firm did not wish to part with them, it was after much pressing that Mr. Wills was allowed to have three plants, which he took away. On reaching home, he at once placed the plants in the propagating-house (it was at the latter end of the summer) and continued propagating them through the autumn and winter; and by bedding-out time in May in the following year, he was able to plant several large beds in the flower garden with this variety, besides two long ribbon borders each 1500 feet long. In a letter before me, written some time since, Mr. Wills wrote:—"At the blooming time it was the prettiest sight I ever beheld, and when the shades of evening were closing in, visitors seemed riveted to the spot by the beauty of the scene, and my employer and all his friends were delighted with the display. My dear old friend, Robert Fish, saw it, and seemed transfixed with delight." Viola cornuta is still cultivated, for its soft pale lilac or mauve colour is so delicate and pleasing; but other varieties, such as lilacina, elegans, and Duchess of Sutherland, of somewhat similar shades of colour, have replaced it to a great extent.

Mr. Wills also took Viola lutea in hand in 1864, having obtained it from Mr. Tyerman, then the Curator of the Botanical Gardens, Liverpool, and used it extensively at Huntroyde Park, Burnley, Lancashire, when in charge of Col. Starkey's fine gardens, and by using it freely, this variety also came prominently into notice, and is still cultivated, but other varieties now entirely supersede it. Here also at Huntroyde, V. cornuta was used on an extensive scale, fully a mile in length of the kitchen-garden borders being edged with it, and from these borders Mr. Wills gathered 80 ounces of seed, for which as many guineas were paid by the seed trade who purchased it. To Mr. John Wills, therefore, belongs the honour of being the first to bring the true Viola of the cornuta and lutea sections into notice as bedding plants, and it must be a source of satisfaction to him to know that the Viola is now so popular and generally cultivated, and new varieties are being introduced.

In justice to the memory of the late Mr. Fleming, so well known thirty to forty years since, and subsequently as the head gardener at Cliveden, near Maidenhead, who obtained a considerable reputation for spring bedding, and largely used the Cliveden bedding Pansies, white, blue, yellow, and purple, the latter still much grown, and invaluable for large masses, but these are all really Pansies, and the three former are almost out of cultivation, and not wanted now. Violas Admiration, Perfection, and Sensation followed Mr. Wills's efforts to give the Viola a place amongst our bedding plants, and V. Admiration is still cultivated, probably V. Perfection also. Then, shortly after, Mr. Richard Dean, of Ealing, introduced V. Blue Bell, which soon became very popular, and is still a great favourite in gardens.

It may not be out of place here to refer, very briefly, to the influence in the past that Mr. Wills has brought to bear on horticulture and floriculture.

Fig. 23.—Iris lævigata. (see p. 168)

Whilst at Oulton Park and Huntroyde, he raised some fine seedling Verbenas, Lady de Grey Egerton amongst them; also some excellent bedding Pelargoniums, amongst them that still cultivated variety, Robert Fish, and the little golden Christine. His name will also ever be associated with the bronze-leaved Pelargoniums, of which he was the raiser of many superb varieties, which passed into the hands of Mr. William Bull for distribution. Of his work as a floral decorator, and the refined taste he brought to bear on this work, I need not say more here.

Just a word or two further as to Violas. Their fame as out-door spring and summer decorative plants is now assured, but as pot plants for greenhouse decoration, very little has yet been done. There is a charming beauty about them as early-blooming pot plants, grown in cool frames until early in March, and then removed to the greenhouse, and so many of them are deliciously fragrant. *W. Dean.*

ROUND MANCHESTER.

(*Continued from p.* 141.)

Beech Lawn, Audenshaw. — The garden of William R. Lee, Esq,, which is of small extent, is largely devoted to the cultivation of Orchids, and is a remarkable example of what may be accomplished with these plants, even when they have to be grown in close proximity to a large town. With such surroundings, it would appear that nothing more than much thoughtful attention, which, with a knowledge of the right thing to do, forms the essentials of good culture anywhere, are necessary to bring the plants up to the standard of those grown in more favoured parts of the country, and in these particulars Mr. Lee, and his gardener, T. Bullington, have been diligent, and with the best results.

Specially noteworthy is the remarkable vigour of all the Dendrobiums, and, in particular, D. aureum (heterocarpum) and its varieties, and the hybrids of the D. Ainsworthii× section; D. cambridgeanum, D. albo-sanguineum, D. Lowianum, and some other species, which are not good doers everywhere, but here they are grown suspended beneath the upper ventilators, which are opened in fine weather. The plants are copiously watered when growing, and are in grand health, flowering freely. One of the most beautiful of these is D. splendidissimum grandiflorum, Lee's var., one of the most beautiful of hybrid Dendrobes, the pseudobulbs of which are more than 3 feet in length, the five leading ones promising even a better show of flowers than the plant bore when it was exhibited at the Royal Horticultural Society. Another remarkable example of fine growth is on the Dendrobium Lowianum, which but few growers succeed in getting even to live for any length of time. The growths on Mr. Lee's plants are some of them 2 feet long, and bear evidence of the progress they have made year by year. Dendrobium formosum giganteum, and the other "nigro-hirsute" Dendrobes, also thrive in a very satisfactory manner, their good condition being attributed to their being kept in a position where they get plenty of air at all seasons, although when growing, of course, they get a good warm temperature at the same time.

Glancing through the houses, and at their more striking contents, we note in the first little lean-to warm-house that numerous plants of Miltonia Roezli and Dendrobium Phalænopsis Schroderianum are in fine condition; and in the next small house, in two divisions, Adiantums and Cœlogynes are well grown.

In the fine span-roof Dendrobium-house, where the stages are edged with Panicum variegatum, and the numerous healthy specimens effectively arranged, the fine condition of the varieties of D. nobile is remarkable, so also D. venus ×, D. Cassiope ×, D. Wardianum and its white variety, D. crassinode, and D. crassinode album, &c.

Among other evidences of good culture in Dendrobiums is a thriving plant of Dendrobium senile, its thick pseudobulbs clad with long woolly hairs, and which, considering it is so frequently imported, is one that is rarely to be found in good condition. Beside an entrance in this house was a panful of Pleione maculata, which was said to bear each year about sixty flowers. Most of these instances point to the fact that ventilation is freely afforded, and carefully attended to at Beech Lawn.

Passing through the Cypripedium house with its healthy and rare contents, the Cattleya-house in which is a fine lot of C. aurea, a specimen of the true C. Hardyana, and good examples of most of species of Cattleya and Lælia, we come to the range of lean-to's under the wall, in the first of which we find praiseworthy specimens of most of the Mexican Lælias—Lælia Gouldiana, L. furfuracea, and the varieties of L. anceps being especially good; L. autumnalis atrorubens has eight to nine flowers on a spike; L. anceps Stella has four spikes, and the pretty hybrid, L. Tresederiana ×, is in bloom.

Continuing through the vinery and Peach-house, and finishing at the cool Odontoglossum-house, we found evidence of good culture in every department, the whole place being a capital example of what may be done with Orchids in or near towns.

The Week's Work.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

PEACHES AND NECTARINES.—Assuming that the trees of these were partly loosed from the walls early in December, proceed at once with the necessary pruning, which will be but little if the trees were gone over in the autumn, and the bearing wood and old fruit-stalks removed, beyond the shortening back of all immature shoots. In the case of trees that were not so treated, considerably more pruning will be required. Do not in any way crowd the shoots, but leave them from 6 to 9 inches apart.

DRESSING THE TREES.—Having finished the pruning, the trees should all receive an efficient dressing with insecticide, going over each shoot separately with a painter's brush, and in cases where the trees were at all infested with black aphis, work the insecticide well behind the buds, which will not be injured if the work is done at once. Hitherto, we have always used Gishurst compound in the proportion of 6 oz. to 1 gal. of water, but we have lately found the Killmright insecticide equally effective, which we use in the proportion of 4 oz. to 1 gal. of water. The trees may also receive a good syringing with a weak insecticide later on, when it is seen that the buds are beginning to move, which will preserve them over the blooming period from the aphis.

TOP DRESSING.—After the above work is finished, remove any inert soil from the border by first loosening the same with a fork, and replace the same with a compost of sound loam, old mortar-rubbish, and burnt refuse, which may be covered with a surfacing of the latter material, or with a good coating of both.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

GENERAL REMARKS.—The genial weather that we have had in this part for the last fortnight makes us think almost that we are in the month of April, still it behoves us to be careful, as we shall have doubtless some bad weather during the month. In any case, the plants will be the better for this mildness, a little more top air on most of the houses for a few hours during the day having been permissible, and the few degrees extra warmth from sunheat will do good. The roller-blinds had better be put in order at once, so as to have them in readiness whenever required, which in the case of East Indian Orchids may now be any day. Masdevallia Harryana, and others of that section, are better if re-potted during this month than at any other time. Let the pots be half-filled with clean crocks, over which a layer of sphagnum moss should be put, and the compost may consist of peat of good quality, sphagnum moss, and fibrous loam in small quantities, all of these being mixed together before proceeding to work. Masdevallia Harryana and vars. are strong-rooting plants, and require something more to root in than most other Masdevallias. Spotting on the undersides of the leaves is the greatest evil that has to be avoided, the cause of which is, I think, an old one, and is due to our growing them rather too cold; and the great deal of moisture that is present in our houses. The house best suited to them is one placed on the north aspect. Keep the temperature at 50° to 55° at night, and 60° by day. The only insect which does any harm is a mealy scale, which is to be found on the under-side of the leaves, but which is easily cleaned off with soft-soap and water. The Chimæra section of Masdevallias grow best in baskets of teak-wood, hung close up to the roof. The potting materials should be similar to those used for M. Harryana, but without the loam, finely-broken charcoal or crocks being mixed with the whole, to render it still more porous, and admit of the flowers readily protruding at the bottom and sides of the basket. This set of Masdevallias is as liable to spot as the others, and from the same causes. A night temperature of 55° is suitable, and the plants should be syringed diligently, or red spider will give much trouble in the summer-time. Our Odontoglossum crispum house is furnished at this period with small hanging pans of Sophronitis grandiflora, and intermixed with these are plants of Masdevallia ignea, the whole forming a pretty picture. As fast as plants of Sophronitis go out of flower, topdress them with clean sphagnum moss, putting the plants into a growing temperature; ours go with the plants of Miltonia vexillaria, and are kept in the small pans alluded to, near the roof. Odontoglossum citrosmum, O. grande, and O. Insleayi should be kept dry for a few weeks longer, and as soon as O. citrosmum shows its flower-spikes, afford the plant water. Keep a sharp outlook for small shell-snails and for woodlice, or the flower-spikes that are pushing up from the new growths will disappear. In a few weeks O. grande and O. Insleayi will be commencing to grow, when it will be time to encourage the pseudobulbs after the rest the plants have had since they last flowered.

FRUITS UNDER GLASS.

By Jas. Whitton, *Gardener, Glamis Castle, Glamis, N.B.*

VINES.—Those in pots will now require close attention. Stop the shoots two or three buds beyond the bunches as soon as the latter are fairly developed. Any which are approaching the flowering stage must on no account suffer from want of water. When in bloom go carefully over the bunches with a large camel-hair brush or small bunch of soft feathers to fertilise the flowers. Maintain a pleasant buoyant atmosphere in the house—but avoid over-dryness. Night temperature 60° to 65°, with 15° to 20° higher during daytime in sunny weather. Disbud any of the permanent Vines as required. We allow the buds to be fairly started, and then rub off all on the spurs except the most promising one. On old Vines it may at times be necessary to have two or more to fill any vacancy, or to admit of the main spur being shortened, in which case select those buds which start close to main-stem. Start Muscats and late-keeping sorts, as previously advised, by shutting up house. They will not require much fire-heat for a week or two, if sun-heat is carefully husbanded by closing house early in afternoon. Before starting see that inside borders are thoroughly watered after getting the usual cleaning and necessary top-dressing. Syringe the Vines at least twice a day with tepid water, and damp surfaces regularly.

THE GRAPE-ROOM.—Frequently examine all the bunches, and remove any berries showing signs of decay. Keep a steady temperature in the room of about 50°, and avoid a close damp air, by warming and ventilating the room as may be found necessary.

STRAWBERRIES.— Those plants which have set, and whose fruit is beginning to swell, will require their final thinning, carefully removing with Grape scissors all small and badly-formed berries, leaving only six or seven of the best on a stalk. If not already done, support each stalk with a twig of Birch, to keep the fruits exposed to light, and from getting splashed when watering the plants. Water carefully, and give weak liquid-manure twice a week until the fruit is nearly fully swelled. The temperature during that stage can be increased to 65° or 70° at night, with a corresponding rise during daytime. Whenever the fruits begin to show colour, keep the house airier and somewhat cooler. Bring on succession lots regularly to supply requirements. Those in bloom must be gone over daily, and fertilised to ensure a good set. Do not hurry them in their earlier stages of growth.

TOMATOS.—The autumn-struck cuttings and early sowings will now require potting-on or planting in beds, where such are at command. If pots are used in which to fruit the plants, use such sizes as the system of training demands. Where the plants are pinched, and three stems grown to bear fruit, pots 16 to 18 inches in diameter will be needed. If the single stem method be adopted, pots 12 to 14 inches in diameter will be ample. Use a good friable loam, if attainable, with sufficient sand and a little wood-ashes to keep it porous; heavy soils may have fine lime rubbish, and bone-meal or similar fertiliser added. Pot firmly, and place the plants in a light warm airy house, in which an average temperature of 60° can be kept. Syringe lightly until the flowers appear, and avoid over-watering. Tomatos are not so readily injured by an occasional "dry" as are many other plants. Sow for early autumn crop. This sowing will be ready to plant in pits and frames, once these structures are clear of summer bedding-out plants, where other conveniences are not available to meet the ever-increasing demands for Tomatos. Amongst the many kinds I have tried, I prefer those medium-sized forms of which Early Ruby, Conference, and Ham Green Favourite may be named as types.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

THE HOLLYHOCK is an old inhabitant of our gardens, and where it succeeds it is one of the finest decorative plants for a shrubbery or herbaceous border. In recent years, fungus diseases produced by Puccinia malvacearum and others have played havoc amongst the plants, and, as a consequence, the cultivation has become somewhat neglected, although at the same time good collections still exist, and in some places the plants are very successfully cultivated. Propagation is effected in various ways—by seeds, cuttings, division, by eyes obtained from side-shoots, when they are getting firm in July or August, and sometimes by grafting on the roots of a strong-growing variety. Autumn-raised plants are always best, although, if seeds are sown at once in pots or pans containing good friable soil, and then placed in a good heat; after they have grown large enough to be handled, they should be potted off in rich soil; and after the pots become full of roots, afforded another shift, keeping them under glass till the end of May, and then planting them out. Plants thus treated make good useful flowering subjects by the time August has arrived. This is the method usually adopted to obtain new varieties, and for securing a large number of plants for ordinary decoration; but in the case of named varieties, the best mode of propagation is by cuttings taken in the autumn or at the present time, which can be easily obtained by placing the old stools in heat, and when the young shoots are about 3 inches long, they should be placed singly in small pots containing light sandy soil, putting them into a slight bottom heat. After roots are emitted, they should be treated like spring-raised seedlings. In case Hollyhocks are attacked by the disease above-named, all diseased leaves should be burnt as soon as the fungus shows itself. It is a good plan when preparing the places for the plants, to fork in a good amount of soot, and thoroughly mix it with the soil, soot being a good thing to prevent or check to a certain extent the ravages of disease. In parts where the soil is tolerably dry, and the winter not too severe, Hollyhocks may be left in the ground, but in most cases, especially with choice varieties, it is advisable to lift them in the autumn, and store them in frames with seedlings, &c.

LOBELIA CARDINALIS, L. SYPHILITICA, AND VARIETIES.—These fine plants must not be forgotten, as they are so useful for grouping in beds, and for forming masses in the herbaceous borders. They are easily propagated, if the old stools are taken out of the boxes or frames where they may have been stored till the present time, and split up into pieces of two or three buds each; pot these bits in rich light soil, and place them in a cold frame, where they make nice plants by the time the planting-out season arrives.

SPRING FLOWER BEDS.—Now that frost has disappeared from the country, all autumn-planted spring-flowering plants should be looked over, and those which the frost has raised out of the soil pressed down into it, and the soil made firm about them. Where gaps occur in the beds, these should be filled up from the reserves, of which there should always be some in pots in cold pits and frames. These remarks apply to Wallflowers, Polyanthus, Silenes, Myosotis, Hepaticas, Aubrietias, Carnations, Arabis, &c., as also to some bulbous plants, trees, and shrubs; in fact, anything that is planted late in the autumn. If a good look-out be not kept for mice, rabbits, and some kinds of birds, they will work sad havoc with Crocus, Narcissus, Tulips, &c., which are now pushing through the soil. The only means to check them is to place traps for the rabbits and mice, and shoot a few of the birds, leaving them on the beds, this being a warning to the others, which they quite understand.

GENERAL HINTS.—All walks and lawns should be carefully swept and rolled, so as to give them as neat an appearance as possible now that the days begin to lengthen; for at this season of the year nothing, I think, looks worse than badly-kept lawns and walks; in fact, bad keeping is more noticeable now than later, when trees and shrubs are coming into leaf.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

FERNS.—The present is a good time for rearranging the fernery, potting those plants that require it, filling up vacancies, top-dressing and filling baskets. Prepare peat, leaf-mould, loam, sphagnum moss and sand; and where silver-sand is scarce, there need be no hesitation in using sea-sand without washing it. Adiantums, Pterises, and Lycopodiums root in it like weeds, the small amount of salt it contains being beneficial to them. Where Adiantum cuneatum or A. gracillimum are required for cutting during the winter months, the plants should be grown in 5 and 6-inch pots, and every frond cut from each as fronds are wanted. The pots from which the fronds are cut may then be stored away till it is time to start them in the spring. This plan keeps the plants in the fernery tidy. Different species and varieties of Adiantum, Pteris and Lycopodium if grown in 3 and 4-inch pots, are useful for filling baskets and other purposes. In potting these, use clean well-crocked pots, with a small quantity of sphagnum moss above the crocks, and also at the bottom of the basket, but do not overfill the pots with soil, but leave half an inch space at the top of small pots, and 1 to 2 inches in large ones, so that plenty of water can be afforded. Specimen plants of Adiantum Farleyense, Davallia Mooreana, Gymnogramma chrysophylla, G. tartarea, and other strong growers among hot-house Ferns, delight in a large well-drained pot, plenty of sphagnum moss above the crocks, also lumps of turfy loam and peat, and plenty of coarse sand. The greenhouse varieties of Gleichenias are among the most beautiful forms for specimens, and they like a large pan or pot, rough fibrous peat and sand, and to be kept clean from thrips. Tree Ferns, Alsophilas, Cyatheas, and Dicksonias should be potted if they require it, but they will grow for many years in the same pot if care be taken to have good drainage, and to afford them a yearly top-dressing of rich soil, and manure-water at times during growth. The Bird's-nest Ferns, Thamnopteris australica and T. nidus, the former a greenhouse variety, the latter requires stove-heat; the Elk-horn Ferns, of which Platycerium alcicorne is a species that does well in the cool house grown on blocks of wood packed with sphagnum moss; whilst P. grande and other species are at home in a warm house. Woodwardia radicans is a useful Fern for baskets, vases, and for rock-work. The most lovely and interesting Ferns are Todeas, most of which will grow well in a cool temperature if afforded shade and plenty of moisture; Todea superba and T. pellucida are two of the best species.

EUCHARIS AMAZONICA AND E. CANDIDA.—Any of these not in good health should be somewhat dried in a gradual manner, and then shaken out of the soil, thoroughly washed in a solution of lemon-tree oil, or the so-called mite-killer, and potted singly in small pots, making use of rich loam and peat, with a small quantity of rotted manure, with sand in sufficient quantity to make the whole porous. After potting and watering, place them in a temperature of 65° to 70°. When the pots fill with roots, re-pot into 6-inch pots, or make up large specimen pots by putting a lot of bulbs together. When in full growth, an occasional watering with nitrate of soda at the rate of $\frac{1}{4}$ oz to 1 gal. of water is beneficial. The drying-off method of treating these plants is frequently a cause of the bulb-mite attacking them; and they will flower quite satisfactorily without drying-off. Moist heat suits the Eucharis, and a position over a warm-water tank in a stove is the best place for them.

DOUBLE AND SINGLE-FLOWERED PRIMULAS.—If these are no longer required for the decoration of the conservatory, the best place for them will be a vinery from which the Grapes have been removed, keeping the plants cool, fire-heat spoiling the colour of the flowers. Afford plenty of fresh air daily, and the same kind of treatment as Primula obconica requires. The latter is one of our best decorative plants, and I do not think that there is any occasion for the scare got up about it, as being a cause of eczema. I have never seen any ill effects from handling it.

THE FORCING-HOUSE.—Spiræas in variety, Deutzia, Lilac, Lilies, Cytisus fragrans, and Zonal Pelargoniums may be pushed on for Easter decorations. Richardias will now throw up their spathes if afforded a temperature from 50° to 60° and an occasional watering with liquid manure will be good for them, after the pots become full of roots; they like plenty of air in mild weather. Pot clumps of Lent Lilies from the open borders, using 6 and 10-inch pots. They will succeed under the same treatment as Richardias.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

HORSE-RADISH.—Where the roots were not entirely taken up before the late frost set in, the remainder should now be lifted, and the strongest roots selected and laid-in in a cool place for use. The ground occupied by this crop should then be heavily manured, and deeply dug or trenched. Straight roots of about the thickness of a man's finger should be chosen for the new sets, passing them between the fingers and the thumb to remove the small root fibres. Holes having been made in the newly-dug ground from 12 to 15 inches deep, one set should be put into each, taking care that it goes straight down, and that the top is about level with the surface of the soil; fill up the holes with fine rich soil. Horse-radish should be planted in rows, 2 feet apart, 9 inches being allowed between the sets in the rows. Should the soil be shallow, so that holes of sufficient depth cannot be made perpendicularly, they may be made in a slanting direction, so that the whole length of the root be buried. When grown in this manner, thickness only has to be obtained, as the sets are already of sufficient length. Crown sets may also be used. The strongest of these should be selected, and all crowns but the central one removed; they should then be dropped to the bottom of holes made from 15 to 18 inches deep, which should then be filled up with soil as before. Horse-radish usually occupies some out-of-the-way place, and a good deal of ground is often taken up with a quantity of useless stuff. If one-tenth of the amount were well cultivated, there would be sufficient useful roots for a large establishment. The ground on which this crop is grown cannot be too rich, and if the plants are well looked after, a plot 10 yards square would furnish a large supply of roots.

GARLIC should now be planted in rows 15 inches apart, and 9 inches between the bulbs, giving them the same treatment as Shallots.

SMALL SEEDS.—Where Couve tronchuda, Celeriac Capsicums, or Chillies are grown, a sowing may now be made of these in very mild heat, so as to get plants of good size by planting-out time. Attend to those (if any), sown some time back, and see that they are pricked off when large enough to be handled.

GENERAL WORK.—When the surface has lost its stickiness, let the hoe be used between all crops sown or planted in the autumn, which will not only check the growth of weeds, but allow the sun and wind to act on the soil, drying and warming it. Put stakes to Peas sown in the autumn, after which place some small Spruce twigs alongside the rows to ward off the wind. Finish the digging of all vacant ground. When the digging of land and the wheeling of manure, &c., are finished, the walks should be put in good order, gravelling them where this is necessary. Where there are box-edgings in the kitchen garden, and these have got too high and broad, the plants may be dug up, and pulled in pieces of size suitable for replanting.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

PLANTS, &c., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, FEB. 14 { Royal Horticultural Society: Annual General Meeting, at 3 P.M. / National Rose Society. / Horticultural Club: Annual Dinner.

THURSDAY, FEB. 16—Linnean Society.

SHOWS.

TUESDAY, FEB. 14 { Royal Horticultural Society, at the Drill Hall, James Street, Westminster.

SALES.

MONDAY, FEB. 13 { Roses, Begonias, and Plants, at Protheroe & Morris' Rooms.

TUESDAY, FEB. 14 { Lilies, Begonias, and Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY FEB. 15 { Important Sale of Lilies, at Protheroe & Morris' Rooms. / Roses and Other Plants, at Stevens' Rooms.

THURSDAY, FEB. 16 { Continental Plants and Hardy Border Plants at Protheroe & Morris' Rooms.

FRIDAY FEB. 17 { Carnations, Picotees, Hardy Border Plants and Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°.1.

Gardeners' Orphan Fund.

ON a day, when if fog-laden atmosphere has the pernicious effects attributed to it, there was abundant prospect of further demands on the Orphan Fund—on such a day [February 3] the annual meeting was held. The assemblage was not large. The fog had something to do with that, perhaps, but there were other causes why a larger gathering cannot be chronicled. One of these is the circumstance that, so far as we know, there was no meeting of any other kind in which horticulturists are interested going on, on the same day, and it is rather exacting to expect gardeners to come from a distance to attend a single meeting. Another reason may be assigned for the small attendance, and that is the perfect satisfaction which we believe is felt on all hands at the way in which the affairs of the Fund are administered. Certainly the energetic committee are entitled to all the praise that can be given them. But the committee want that appreciation shown in a more tangible form. They would rather feel that they were a little less responsible than they are for the welfare of the Society, or rather that the responsibility was a little more widely diffused among the gardeners of the kingdom, and not so much concentrated upon themselves. A "slight falling-off in the annual subscriptions," even if it be but slight, is a misfortune, and one which must be checked at once. There are hundreds and thousands of gardeners in the country who never subscribe a penny to the Fund, and yet the full annual subscription is only 5*s*.—not much more than a penny per week. If ten thousand gardeners would each contribute 5*s*. a year an annual income of £2500 would be at the disposal of the committee, instead of the meagre sum of £460 now received.

We are afraid the munificence of generous friends, and especially the sums collected from outsiders at or in consequence of the annual dinner, have a paralysing effect on the gardeners who do not recognise the need for their pennies. We are not so destitute of worldly wisdom as to deprecate the value of the help afforded by the generous and the well-to-do, but we do say that it would in all ways but one be infinitely more satisfactory if the support of the orphans depended more fully on the pennies of the gardeners, as it might readily do, than on the pounds of strangers and outsiders. The exception to our statement is, of course, the extra work that would be thrown on the Secretary. The local secretaries could, however, greatly lessen that by acting as collectors, and by means of postage-stamps, as is done in the Post-office Savings Banks, small amounts might be accumulated at relatively little cost and trouble. In any case, the facts stare us in the face, that a penny a week from each gardener in the country, assuming there are only 10,000, would cover the present expenditure three or four times over, and consequently allow a proportionately larger number of orphans to secure the advantages of the Fund.

The circumstance that H.R.H. the Princess of WALES lends her name to the charity, and expresses the hope that by so doing she may assist the objects of the charity, is a matter for congratulation. Nothing, we are sure, would give her Royal Highness greater pleasure than to know that her example had stimulated every gardener in the kingdom to contribute a penny a week to the fund!

Incidentally, we learn that two of the children earliest elected are now, by reason of their age, no longer competent to receive the benefit of the Fund. This is, we suppose, the first time in the history of this still young Fund that such an occurrence has happened. It is also noteworthy that, as we are informed, not one child out of all that have received the benefit of the Fund, has died since the inauguration of the Society, in Jubilee year. This is a fact which shows, indirectly, at least, that the children are well looked after. Lastly, as these pages are passing through the Press, we learn that Baron FERDINAND DE ROTHSCHILD has kindly undertaken to preside at the annual dinner on March 22.

Manures.

SHALL we ever be able to dispense with the use of manures? The question seems absurd when we think of the constant drain to which we subject the soil; but there is another way of looking at the subject. What if we leave Nature to restore the balance? If this can be effected, will it not be much better done than we could do it? Doubtless; but the process would be slow, and short-lived mortals are in a hurry. To lie fallow seems a waste of time and opportunity, but the fertility of the soil is nevertheless being restored all the time; whilst, on the other hand, the proceedings of the cultivator are often marked by great and needless waste. Messrs. MUNZ and GIRARD, in the *Annales Agronomiques*, have lately been investigating this subject, and they show how much of the value of manure is lost in stables by the ammoniacal fermentation that ensues. Much of this can be obviated by the use of peat moss or of earth rich in humus. If the loss of nitrogen in manure could be entirely prevented, there would be so much the less necessity to purchase nitrate of soda or sulphate of ammonia. Modern research has proved that some plants (Leguminosæ) can and do appropriate the nitrogen of the atmosphere by the aid of certain microbes of which we hear so much nowadays, as well as of certain mosses and algæ, according to the most recent researches of SCHLOESING and LAURENT. These plants, then, yield the cultivator a constant supply of nitrogen. If the loss of the nitrogen so gained were prevented by fixing the ammonia which escapes from manure-heaps, and if the loss of nitrogen by means of drainage were obviated, the cultivator would be put into possession of ever-increasing stores of nitrogen without going to the expense of purchasing expensive manures.

Basing his recommendations on such facts as these, M. DÉHERAIN counsels the sowing immediately after the removal of the stubble of some quick-growing crop, which will appropriate the nitrogen, and thus prevent its escape in the drainage-water. In the plant, the nitrogen will be stored up or used up in the formation of albuminoids in the plant, so that when the crop is ploughed in, all the nitrogen which otherwise would have been lost in the drainage-water is restored to the soil. In this way the value of the old practice of "green manuring" is explained.

THE JAPANESE IRISES.—Our illustration (fig. 24) represents the mode adopted by the Japanese in their cultivation of these lovely plants. For the photograph whence our cut was taken, we are indebted to Mr. JAMES H. VEITCH, the record of whose wanderings is given from time to time in our columns. He will doubtless in due time, in course of his letters from Japan, allude to these plants, so that we shall confine ourselves to the mere statement that they are cultivated as bog or marsh plants, and leave Mr. VEITCH to narrate his own experiences later on. The proper name of these flat Irises is Iris lævigata, according to Mr. BAKER's *Handbook of the Irideæ*, p. 13, wherein we are told that the plant is a native of Eastern Siberia and Japan. Under the supposition, as we infer, that the plant was of Japanese extraction solely, it was at one time known as I. Kæmpferi. It was, we believe, originally introduced from Japan by VON SIEBOLD, and flowered in Verschaffelt's nursery at Ghent in 1857, a figure being given in the *Illustration Horticole*, t. 157. On July 11, 1874, we gave in these columns a full account of the curious botanical features of the plant, an account of which it was interesting to see the confirmation in the *Botanical Magazine*, t. 6132, published in the following November under the name of I. lævigata, *see* present issue, p. 165, and where the normal form, with recurved sepals or falls, and erect petals or standards, is given. According to Sir JOSEPH HOOKER, Kæmpfer, (*Amœnitates Exoticæ*, p. 873, published in 1712) was the first to call attention to the plant. In the year (1874) M. VAN HOUTTE gave coloured figures of several varieties in his *Flore des Serres*, t. 2073, 2074, stating that they had been in cultivation in his nursery for several years. In the United States, according to an article in that excellent and most interesting journal, *Garden and Forest*, it was introduced by the late THOMAS HOGG in or about 1869, and they were described in the *American Agriculturist* for 1870 by our old friend, Dr. GEORGE THURBER. Mr. GERARD, the author of the article alluded to, says they are cultivated as subaquatics, but they do well in a moderately moist border, or elevated slightly on the margins of water, where their roots easily find abundant moisture. Under similar circumstances, they grow well here, though all growers are not equally successful. At Wisley Mr. GEORGE WILSON grows them well, giving them moisture at the roots, and full exposure to the sun at the tops.

Linnean Society.—At the evening meeting, to be held on Thursday, February 16, at 8 P.M., the following papers will be read:—1. "On the Life History of the Æcidium on Paris quadrifolia," by Dr. Chas. Plowright; 2. "Contributions to the Natural History of the Flower," by J. C. Willis.

University College of Wales.—We are pleased to receive the prospectus of the Agricultural Department of the College. The instruction given is practical as well as explanatory and didactic. The Principal of the College is T. F. Roberts, Esq., the Agricultural Professors being T. Parry, J. Wilson, J. Alan-Murray, J. Dawson Roberts, Dr. Snape, A. W. Warrington, J. R. Ainsworth Davis, and others. The College is at Aberystwith.

Royal Horticultural Society.—The next meeting of the Society will be held on Tuesday, February 14, at the Drill Hall, James Street, Westminster. As the annual general meeting will be held on the same day at 3 P.M. at the Society's offices, 117, Victoria Street, it is expected that there will be an unusually large attendance of Fellows to hear the report of the past year.

Crystal Palace Show Fixtures in the Current Year.—The directors of the Crystal Palace have now fixed the dates of their shows for 1893. The spring exhibition of plants and flowers will be on Saturday, March 25, and the great summer exhibition on Wednesday and Thursday, May 10 and 11. The National Rose Society's exhibition of Roses is fixed for Saturday, July 1, and the National Dahlia Society's show of Dahlias on Friday and Saturday, September 1 and 2. November 3 and 4 are the dates of the grand Chrysanthemum exhibition.

Birmingham and District Amateur Gardeners' Association.—A meeting of this Association was held, on February 1, at the Temperance Institute, Corportion Street, under the presidency of Councillor R. F. Martineau. Mr. A. Roe read a paper upon the advantages and utility of the Society. He expressed the opinion that the members would greatly benefit by their association, inasmuch as they would be able to exchange ideas on the subject of gardening, and would obtain much useful information from the papers that would periodically be read by members. Economy would be practised, because members could exchange seeds and cuttings, and the exhibition of plants by members would, he contended, create a healthy and useful rivalry.

National Rose Society.—A meeting of the committee will be held at the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 14th inst., at 3 30 P.M.

Horticultural Club.—The annual house dinner of the Club will take place on Tuesday, February 14, when the chair will be taken by Sir John T. D. Llewelyn, Bart. (Chairman of the Club).

Green-stuff in London.—A correspondent of some years' standing, whose avocation brings him into very frequent contact with salesmen in the various vegetable markets, insists that for some time past there has been a falling-off in the sale, and therefore consumption, of green-stuff of nearly every description. Of course, during "hard" weather the supply is frequently very short, and prices in sympathy; but in all the open weather of recent days the supplies have been fairly good. The prices are within reach of most people, but the demand is discouraging. Retail vendors do not speak encouragingly

Fig. 24.—A plantation of Iris lævigata (kæmpferi) in Japan. (see p. 168.)

of their prospects—certainly some of the stuff they had on hand was not fresh, and very uninviting; but as all kinds of meat appear to sell well, our correspondent has come to the conclusion that either the taste has become affected, or the price of fuel interferes with the matron's expenditure. Perhaps were there an extension of the market system—a score instead of the few now in existence—the sale of green stuff might be doubled, which means very much to the grower, as its consumption signifies to the consumer.

PROFESSOR WESTWOOD.—We extract the following particulars from the February number of the *Entomologists' Monthly Magazine*, and which may supplement our own remarks in a former issue:—"He was born at Sheffield on December 22, 1805, and so had recently completed his eighty-seventh year. His father was a die sinker at Sheffield, and his early education was at a Friends' School in that town, so presumably he came of a Quaker family; be that as it may, he was himself a staunch churchman. His family removed to Lichfield, and thence he went to London to be articled to a solicitor. A fragment of an early autobiography is to be found in the *Entomologist* of 1842, where he says:—'It was in the autumn of 1821 that I came up to London to be articled to a profession. For the next six months, however, instead of studying *Coke upon Lyttelton*, I greedily devoured all the information to be obtained from SAMOUELLE'S *Compendium*, HAWORTH'S *Lepidoptera Britannica*, SHAW'S *Zoology*, and other similar works.' He was, however, admitted as a solicitor, and for a short time was a partner in a firm. He never really practised, but devoted himself to entomology and archæology, and having some private means, augmented his income by writing and drawing, for it was probably by his rare artistic talent that he acquired much of his justly great reputation. His drawings of insects were masterpieces of accuracy, without the slightest attempt at effect, rapidly executed, and few have equalled him in correct delineation. There certainly never has been an entomologist who left behind him so much evidence, in practical work, of his ability to delineate insects, even to the most minute dissections. But WESTWOOD was much more than an artist in entomology. There probably never has existed, and, in the present state of the science, there can never again exist, one who had so much general knowledge, both from personal investigation and a study of the works of others; one who was less of a specialist in the modern acceptation of the term. It is true he was a specialist, but it was in the way of taking up small groups in all orders, and working them out thoroughly, his artistic talent giving merit and force to those small monographs. Under a somewhat brusque manner was concealed a hearty sympathy for all real workers, and if he offended, it was commonly in the way of pointing out to would-be exhibitors, &c., of supposed novelties, that some one or other had already made similar observations, his vast memory rendering him very dangerous in this respect. In 1833 the Entomological Society of London was founded, and WESTWOOD identified himself with it from the commencement. He was elected Secretary in 1834 (Mr. G. R. GRAY was the first Secretary), and continued such for several years; by his vigour he successfully combated an opposition that threatened to crush the infant society (see Postscript to Introduction to vol. i. of the *Transactions*). The Rev. F. W. HOPE, a wealthy amateur, was then President, and became WESTWOOD'S warm patron. His interest in the welfare of the society never flagged: he was President on three periods of two years each, and on the occasion of the Jubilee of the Society in 1883 was appointed Honorary Life President. But his papers were scattered through innumerable publications; there never was so prolific a writer, there is scarcely a family of insects in any order on which he did not treat, even to the most minute, for he was an adept at microscopic work almost to the last. As to the accuracy of his work there can be no question, and few men have made fewer mistakes. His separate works were many. Even if he had written nothing else, his *Introduction to the Modern Classification of Insects*, is sufficient to stamp him as the foremost entomologist of this or any other age; a monument of original observation and careful compilation. This work gained him the Royal Medal of the Royal Society in 1855, but he persistently then, and on subsequent occasions, refused to be nominated for election as F.R.S., though his success was certain. Perhaps he considered the views of the Society as already too advanced, and soon afterwards the teachings of DARWIN and others revolutionised natural science, and no doubt caused him genuine pain, for he never identified himself with Natural Selection or Evolution, and indeed, it is probable he never fully understood the bearing of the new school of philosophical thought. He was elected into the Linnean Society in 1827, and was on the Honorary List of nearly every entomological and kindred Society of his period. He was on the staff of the *Gardeners' Chronicle* as entomological referee for nearly half a century. We have alluded to his connection with the Rev. F. W. HOPE. This had a vast influence on his career. In 1858 HOPE presented his collections to the University of Oxford, combined with that of WESTWOOD himself, which he purchased, and endowed a professorship, which HOPE intended should be of entomology, but a difficulty was thrown in the way, and a compromise was effected by instituting a Chair of Invertebrate Zoology. WESTWOOD was the first Hope Professor. Hitherto he had resided at Hammersmith, but henceforth he lived at Oxford. He was made Honorary M.A. and Honorary Fellow of Magdalen College. He soon became a striking feature in the University, and under his charge the entomological collection increased vastly, though it is still only partially arranged."

OPEN SPACES IN AND AROUND LONDON.—The Metropolitan Public Gardens Association at their last meeting decided to expend £20 in preparing maps and plans, illustrative of their work, for the exhibition in Chicago. A grant of £100 from the Clothworkers' Company was announced. In accordance with plans and estimates presented, sums of £130 and £308 were voted for the laying-out of an open space in Bermondsey and St. Thomas' Square, Hackney; and £100 towards the acquisition of 5 acres, formerly part of Wandsworth Common. Mr. WILSON NOBLE, M.P., has sent £200 for tree planting in thoroughfares in "London over the border," otherwise Barking, E. The secretary stated that only about £700 was now required to complete the purchase-money of the Hilly Fields, Brockley. It was decided to apply for the occasional opening to the public of the Hon. Artillery Company's drill ground in the City Road; and to write to the First Commissoner of Works respecting the possibly irreparable injury which might be caused to Kensington Gardens by the proposed underground railway unless it was found feasible to insert efficient protective clauses in the bill which is being promoted this session for the construction of the line.

FLORA OF JAPAN.—In the number of *Garden and Forest* for January 18, 1893, we find the first of a series of articles on the "Forest Flora of Japan," by Professor SARGENT, who has just returned to Boston after a visit to Japan. During part of his journey he was accompanied by Mr. H. J. VEITCH, extracts from whose letters are appearing in our columns. Professor SARGENT emphasises the previous statements of ASA GRAY as to the extreme richness of the Japanese Forest Flora. In the Eastern United States, exclusive of Southern Florida, there are 233 species of trees distributed in 133 genera. The Japan-Manchuria region, comprising Eastern Manchuria, Kurile Island, Saghalin, and the four great Japanese Islands (but not the Loochoo group, which is tropical) has 241 species in ninety-nine genera—a proportion of about one in ten of flowering plants. The percentage of woody shrubs is also very large—one to four of the whole flora. Moreover, the number of distinct species growing in limited areas is very great. In Yezzo sixty-two species were found in an area only a few miles square. For the full elucidation of the matter, however, a knowledge is required of the flora of Corea, and this at present is, to a very large extent, lacking.

KNIPHOFIA.—In an article devoted to the fine collection of these magnificent plants in the nursery of M. EDWARD PYNAERT of Ghent, and published in the *Revue de l'Horticulture Belge*, the writer enumerates some varieties which are not much known in this country. Among them are K. (or Tritoma) Pfitzeri ×, with enormous spikes, the deep carmine of which is associated with scarlet flushed with orange. The throat of the perianth is rose-coloured, while the interior of the limb is of a superb golden-colour. A chromatic description indeed! Lemoine has red flowers which produce an excellent effect; H. Cannell has flowers intermediate in colour between minium and cinnabar; Counsellor Späth [Our cultivators will never say Oekonomierath Späth!] has spikes of a reddish-orange colour; Otto Mann is of a shaded red passing to orange; Max Leichtlin, a plant of less stature, has translucent flowers which appear as if lighted from within. This variety produces a succession of flowers. Ober Gaertner Ehmann has coral-red flowers with yellow anthers; T. S. Ware, of a deeper colour than the preceding, has blackish stamens; Hofgaertner Fiesser is at first scarlet, afterwards yellow, and a late bloomer; Auguste Wilhelm produces spikes of a reddish-copper colour, as if it were soaked in blood. Has anyone tried to force these magnificent plants? Perhaps they would come into bloom at a period when flowers are not scarce, but at any rate the experiment might be tried.

"THE BOTANISCHE ZEITUNG."—Professor Count SOLMS-LAUBACH indulges in an historical retrospect on the occasion of the fiftieth year of publication of this well-known and most useful botanical journal. It was founded by Dr. PHILIPP PHŒBUS, and among the many distinguished botanists who have been connected with it are CARL MÜLLER, SCHLECHTENDAL, VON MOHL, HOFMEISTER SACHS, DE BARY, and CASPARY. Count SOLMS is the present Editor, and in his hands it has lost nothing of the celebrity it has long enjoyed.

"THE GARDEN ORACLE."—We are rather late in announcing the publication of this useful little volume, and this makes us the more desirous of commending its merits to our readers. It contains an excellent list of the new plants of the year, articles on injurious insects, lists of the horticultural societies of the United Kingdom, articles on technical education in horticulture, etc., etc.

FORESTRY EXHIBITION.—It is said that a forestry exhibition is contemplated at Earl's Court this summer.

THE WINDSOR, ETON, AND DISTRICT CHRYSANTHEMUM AND HORTICULTURAL SOCIETY.—Mr. H. FINCH, Secretary, states, that the second annual exhibition of the above Society will be held at The Albert Institute, Windsor, on Friday, November 10.

WIDCOMBE HORTICULTURAL SOCIETY.—This flourishing little Society, in the neighbourhood of Bath, is receiving hearty support, and promises to do good service; moreover, it has managed to keep its expenses within its income. On the occasion of the annual meeting, held on Monday, January 30, the Secretary, Mr. MOGEE, was presented with a barometer by the Rev. LA TROBE FOSTER, in the name of the members of the Society, in recognition of his valuable services.

THE FALSE ACACIA FOR FORAGE.—M. GERARD contributes to the *Annales Agronomiques* a valuable paper on the use of leaves of various trees for feeding stock, basing his remarks not only on the absolute chemical composition of the leaves, but also on their digestibility by the animal. The results of feeding an animal on tree leaves show that, weight for weight, tree leaves are as nutritious as the best

leguminous forage to horses, sheep, pigs, cattle, goats. Of all the trees analyzed, the Robinia, or so-called Acacia, is the most valuable from this point of view. Travellers in France will remember how often it is used on railway-banks to keep the slope in position. It is now shown that its leaves are extraordinarily rich in digestible food, so that M. Girard recommends its plantation on railway-banks, waste-lands, and dry places, where it may be grown as pollards or coppice. One objection to its use is the presence of rather formidable spines; but there are spineless varieties which could be employed, and by protecting the hands with stout gloves, no greater difficulty would be encountered than with Gorse. On soils so sterile and poor that it does not pay to cultivate them, and where manure would financially be a useless expenditure, trees may be grown. The leaves from these, used as litter, would eventually yield a supply of nitrogen and phosphoric acid for the cultivated land, so that the forest contributes indirectly to the enrichment of the arable land. The advantage to be derived from the green leaves used as forage is, of course, greater; the nitrogen returned to the soil in the manure is, of course, greater than what is derived from the dead leaves. Of course, the wholesale removal of leaves would be injurious from the point of view of timber-making, but there are trees whose timber is of relatively little importance, but whose foliage would be very valuable as forage. M. Girard's paper is one of great interest, and should be read by all interested in stock and flock matters.

"Les Orchidées de Semis."—Under this title, M. Ernest Bergmann has reprinted from the *Journal of the National Horticultural Society of France* for 1892 a complete list of hybrid Orchids up to 1891. More than 300 hybrids are catalogued, and their origin is indicated. In some cases descriptive notes are added. The list will be very serviceable, and will doubtless be republished, in which event it may be well to correct the statement on p. 75, that Mr. Philbrick was gardener to "M. Sigismund Rucker, Esq."

Carnations.—The number of the *American Florist* for January 19 is almost entirely taken up with matters relating to the Carnation. The votes of five experts in different parts of the States were taken independently, and the results are given in some eleven columns. Commercial interests are alone considered. Numerous illustrations from photographs are given, but the colours of the flowers do not lend themselves to this style of illustration.

Iris alata var. Leichtlinii.—Mr. Ewbank tells us of a new variety, flowers of which he has just received from Herr Max Leichtlin, and which surpasses in beauty anything of the kind he has seen before. The colour is somewhat deeper and the size larger than in any previously seen form. Mr. Ewbank suggests that it be called Iris alata var. speciosissima, it being as much superior to the var. speciosa, as that is to the ordinary type of alata.

Finnochio.—The notice found in our columns recently of this Italian vegetable, has been the means of exciting some interest amongst our readers, resulting in enquiries being made for seeds. Last week we observed that we did not know of any seedsman in this country who sold seeds of the plant, but Messrs. R. Veitch & Son, Exeter, request us to say that they have it in stock under the name of Giant Fennel.

National Footpath Preservation Society.—We are glad to see that this society is progressing, both in the number of its members and its finances. When keepers are allowed to put down wire with a double row of fish-hooks 4 inches apart, it may be hoped that cruelty to animals, as well as obstruction to footpaths, may receive the attention of the society. Jets of steam, and the turning of bulls into fields crossed by a footpath, are, it appears, ingenious devices to deter people from using a footpath, and this sort of thing is done by the same class of people who have the incredible meanness to appropriate to their own use the strips of green turf by the side of public roads when it suits their purpose to do so.

Stock-taking: January.—From the summary of imports for the past month of foreign and colonial produce, we find there is a decrease, as compared with January, 1892, of £5,359,356, figures, we have noted, once or twice before, which would be misleading, if applied to a reduction of the quantities of goods or materials imported. Beyond remarking that there is some decrease in the quantities of sundry imports, which need not be specially noted, we give the following extracts from the summary of imports for January:—

Imports.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£38,485,244	£33,125,888	—5,359,356
§II.—(A.) Articles of food and drink—duty free	11,563,380	10,228,593	—1,334,787
(B.) — do., dutiable	2,006,815	1,891,000	—115,815
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	11,887,376	8,844,783	—3,042,593
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,446,726	2,246,911	—199,815
§IX. — Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,444,180	1,252,866	—191,314
(B.)—Parcel Post ...	54,430	92,103	+37,673

The extracts respecting fruits and vegetables are interesting: the careful observer will note an intimate connection between market prices and the "difference" column of the following returns for the past month:—

Imports.	1892.	1893.	Difference.
Fruits, raw:—			
Apples ... ... bush.	326,826	209,262	—117,564
Cherries ... ... ,,	...	...	...
Plums ... ... ,,	3	104	+101
Pears ... ... ,,	3 742	2,518	—1,224
Grapes ... ... ,,	334	523	+189
Unenumerated, ,,	16,995	16,852	—143
Onions ... ... ,,	371,925	273,660	—98,265
Potatos ... ... cwt.	65,268	112,650	+46,382
Vegetables, unenumerated, raw, ... value	£55,617	£37,813	—£17,804

So far as regards the importation of grain from southern Russia—that long-time past granary—agriculturists at home have nothing to fear; an enormous extent of the black loam lands of that far-extending district having broken down into what is described as a Sahara-like condition. Far-spreading areas have been thrashed out by the farmer and given back to Nature—the soil dry to a depth of several feet, blown about by easterly gales, enveloping and stifling seed crops, filling up water-courses and lakes—to an extent known only in Africa. The tillers of the soil and their landlords ask for Government help in rejuvenating the land by means of irrigation-works on a gigantic scale, replanting timber in denuded districts, and furnishing manure and seed; but it does not appear such relief is forthcoming.

The Exports

of British and Irish manufactures are valued at £18,026,019 for the past month, against £19,146,704 in the same month of 1892—or a decrease of £1,120,685. We have an idea that in some things stocks must be getting low; and we may just add that the exports of foreign and colonial produce foot up £4,786,274, or an increase of £657,628, as compared with the same period last year. In face of the "history-making" going on all over the world just now, it would be a vain theory to indulge in prognostications; they constitute a class of literary enterprise which does not always pay.

Referring the other day, at the Chamber of Commerce, to the trade of the country, to meeting foreign competition by low prices and good work, helped by low charges for freight, Sir J. Lubbock stated that prices had probably reached their lowest point in some important manufactures, free imports of raw material, of course, backing up low export prices. He drew attention, indirectly, to the necessity for encouraging inventors by suggesting that manufacturers might be aided by improved processes. There is no man more deserving of help than the inventor, and the securing of his rights ought to be made as easy and cheap to him as an investment in seed and manure.

Corbridge and District Gardeners' Society.—A meeting of this Society was held in the Town Hall on Monday night, January 23. Mr. Charlton, Farnley Grange, presided, and Mr. W. J. Watson, Corbridge, read a paper on his experiences as an exhibitor of spring flowers; for which a vote of thanks was given. A discussion followed the reading of the paper.

Tufted Pansies.—We are puzzled to understand the application of the word "tufted" to the bedding Violas. We are told that the term tufted has been used to distinguish plants of a *spreading habit* like Pinks, Aubrietias, &c., from plants with simple erect stems, such as the Stock, &c. To apply the term tufted to plants of a spreading habit, is a complete contradiction of terms, but in the employment of popular names there is no guide but custom and caprice.

Botanic Garden Appointment.—Mr. Robert Harrow, formerly of Cambridge and late of Kew, has been appointed, from the latter establishment, to the foremanship of the houses in the Royal Botanic Gardens of Edinburgh.

Improvements in the Parks.—Some planting alterations in Hyde Park, the Green Park, and Kensington Gardens, which are being carried out just now, though not of an extensive nature, deserve notice by reason of the improvements effected thereby under Mr. W. Browne's superintendence. A corner of Rotten Row, facing Alexandra Gate, which was said to be dangerous for riders, has been formed into a new raised shrubbery, and the railings opposite put back, so that the ride now takes an easy and graceful sweep, where hitherto there has been an awkward turning, and what once presented a bare and unfinished appearance, becomes an ornament in the landscape, and the means of preventing a recurrence of accidents such as took place last season. An improvement of outline and level of the plantations, and replanting the latter, is taking place at the west end of the "Ladies' Mile." What will have the very desirable effect of throwing up the points of view and hiding the masonry, is in course of progress at the south end of the Serpentine Bridge, by re-laying out and raising the level of the plantations here. The footpath also will be reduced, and the eye will be refreshed by resting on a greater breadth of green sward. In what might, not inaptly, be termed the Park of Walks, the Green Park, Mr. Browne is planting bold groups of trees and specimens in desirable positions, of such as Acers, Planes, the Tulip tree, Elms, Birch, Thorns, Mountain Ash, Pyrus, &c., in the formal enclosures, with the praiseworthy object in view of taking off the flatness of aspect hitherto presented, giving greater diversity, and of concealing as much as possible the numerous but necessary footpaths which cross the park in all directions. In St. James's Park the rockery is being replanted with suitable materials, and when finished will doubtless prove an interesting feature in the surroundings. At the south end of the Broad Walk, Kensington Gardens, a great improvement has been effected, in the making of a new footway, plantation, and re-laying out a piece of ground; here will be planted in quantity Vincas and bulbs in variety, such as Narcissi, Crocuses, Wild Hyacinths, &c. The herbaceous borders hereabouts are now receiving careful attention, and it was pleasant to hear, as

showing the popular taste for these desirable and showy subjects, that they will be planted in bold clumps for future effect. The various alterations and improvements as to planting, &c., carried out two years ago in what is known as the north flower walk (although bedding is not carried on here now) are now being seen to advantage, as the trees, shrubs, &c., are getting established in the groups, and the points of effective view opened up made clearly discernible. Let us hope the silly avenue lately planted in Ravenscourt Park, to its great disfigurement, will speedily be removed. It is as well to say that the superintendent is not responsible for this monstrosity.

THE LAW OF COMPENSATION.—High quality in fruits, says Professor L. H. BAILEY in *Agricultural Science*, is supposed to exist at the expense of some other character. The best fruits are thought to be tender, unproductive, and to lack vigour, or to be small and dull in colour. Professor BAILEY discusses the question at some length by the aid of statistics, and sums up as follows:—"It is evident .... that quality and other characters of cultivated fruits appear independently of each other—that there is no true correlation between these characters. There is a general increase in all characters as amelioration progresses, at least in all characters which are particularly sought by horticulturists, and this fact must ever remain the chief inspiration to man in his efforts to ameliorate plants." And yet horticulturists are too well aware of fruits of high quality which are "bad doers" or "bad croppers," and among florists' flowers the tendency to sterility as the flowers improve is often marked. True, the plants in that case are selected for their flowers mainly. Still, the grower is not too well pleased if he only gets half an ounce of seed from a whole houseful of plants, as happens with Cyclamens, Calceolarias, &c.

TESTIMONIAL TO MR. W. YOUNG.—A large gathering of the leading horticulturists in Scotland met together at the Waterloo Hotel, Edinburgh, on the afternoon of February 8, to present a testimonial of £100 and a piece of plate to Mr. WILLIAM YOUNG, the genial treasurer of the Royal Caledonian Horticultural Society, in recognition of his fifty years' service. Mr. D. W. THOMSON, presided. In his opening remarks, he gave a sketch of Mr. YOUNG's career, and called upon Mr. W. THOMSON, of Clovenfords, to present the testimonial to Mr. YOUNG. Mr. THOMSON, before presenting the testimonial, gave an interesting account of the progress of the Royal Caledonian Horticultural Society, and said that its success was attributable in a great measure to Mr. YOUNG. Mr. YOUNG, in his reply, showed plainly how much he had the interest of the Society at heart.

THE LATE MR. BOSCAWEN.—We desire to call the attention of our readers to the article on Barrier Island at p. 161, not only on account of its intrinsic interest, as showing the steps taken by the New Zealand Government to preserve some of the most remarkable features of the flora and of the fauna of the islands, but also because it is written by the son of an ardent horticulturist whose memory is held dear by a large circle of friends and associates—the Hon. J. TOWNSEND BOSCAWEN. We may state by the way, that a Tree Fern, which he was the first to grow out-of-doors in this country, now overshadows his grave in the churchyard at Lamorran. Mr. HUGH BOSCAWEN has already contributed some characteristic drawings to KIRK's excellent *Forest Flora of New Zealand*, and will, we trust, emulate the zeal of his father.

APPLE-SHAPED QUINCE.—M. ANDRÉ has, in the *Revue Horticole*, a coloured illustration, a description of a Quince having the shape of Pearmain Apple. M. ANDRÉ identifies the Quince in question (which he met with in Hungary), with the variety commonly cultivated in the United States, and which is considered superior to the common Quince. As there are several forms of it, of varying quality, it is desirable to choose the best.

FORESTRY

VALUE OF THE CLUSTER PINE IN BRITAIN.

THERE are at least three different lights in which a tree can be accounted as valuable—1, in a purely economic sense; 2, for purposes of ornament, and, 3, for some peculiar value that is attached to it, such as providing shelter, succeeding by the seaside, or other allied purposes, and for which the individual nature of the tree renders it best adapted. The Cluster Pine (Pinus pinaster) is a good example of the latter class of trees, for although highly valued as a maritime tree, and for reclaiming sandy seaside wastes, neither the value of timber nor ornamental appearance can call for any special remark. With regard to the timber of this Pine, I have lately been undertaking some experiments regarding its lasting qualities when subjected to a variety of treatments, but in so far as any value of the wood is concerned, the results of the experiments are hardly worth repeating.

At Holwood in Kent the Cluster Pine grows to a large size, the deep gravelly subsoil evidently being congenial to its growth and perfect development. In one of the woods at Keston there are large numbers of this tree that must have been planted about seventy-five years ago, and the following will show to what size they have attained in that time. The average contents of the trees would, from measurements just taken, appear to be fully 90 feet, but there are not a few specimens containing upwards of 120 feet, the average stem-girth at 5 feet up being about 8½ feet, but in most instances the stem-girth at 30 feet would be little less than that at 5 feet. A goodly specimen that was as straight as an arrow, and containing 99 feet of wood, was partially uprooted during a storm three years ago, and advantage was taken of the opportunity to have the timber converted in various ways, so that its value for estate purposes generally could be determined. Owing to the great quantity of resin present in the timber, the tree was weightier for its bulk than any other species that had come under my notice, with the exception, perhaps, of Abies grandis. A great part of it was sawn into boards of 2 inches in thickness, and as many of these boards were fully 3 feet wide, their value for constructive purposes, had the timber been of good value and worthy of conversion, would have been great. The wood works beautifully and clean, taking a smooth glossy surface under the tools of the carpenter, and several of these 3-feet-wide boards were cut into 6 feet lengths, and planed smoothly for preserving as samples of the wood. To various uses the remaining boards were applied, but one instance of their lasting quality will be sufficient. A number, fully thirty, were placed as boarding for the floor of a dry faggot-shed or barn—a well-built structure, and thoroughly ventilated. On examining these boards a few weeks back, it was found that they were one and all perfectly rotten and falling to pieces, and that after they had not been in position more than about eighteen months. Every board had to be removed, having become permeated with dry-rot to such an extent that when let fall on the ground they fell to pieces. This was all the more strange as the boards had been allowed plenty of air, they being not nailed down or carefully placed side by side, but simply laid down with the double object of seasoning and to form a temporary wooden floor beneath the dry faggots. When we take into consideration the size and age of the tree from which the planks were cut, as well as the great quantity of resin present, and which rendered the log so weighty in transit, the case seems all the more remarkable. But it has long been known that the timber of this Pine is of no great value, and even for firewood purposes it comes in about third-rate.

Regarding the value of the Cluster Pine for seaside planting, we are all familiar with the reclaiming of vast tracts of shifting sand in France by means of this tree, although, curiously enough, in this country a similar amount of success has not crowned the efforts; and one case in Wales, which will be brought prominently to the front, has been a marked failure. *A. D. W.*

CAREX JAPONICA VARIEGATA.

THE fig. 25, p. 173, is that of a pretty decorative species of Carex—a large genus of grass-like perennial herbaceous plants, few of which possess any horticultural value. The one under notice was shown by Messrs. J. Veitch & Sons at a meeting of the Royal Horticultural Society in 1889, and on that occasion it received a First-class Certificate. A correspondent in Gloucestershire, who kindly sent the plant for our inspection, sent also the following particulars of his method of cultivating it:—"Grown in 5-inch pots, it attains a height of 18 inches or 2 feet, and is a capital plant for room-decoration, withstanding a dry atmosphere so well. As a plant for the dinner-table, it is, in my opinion, second to none. The variegated variety is a particular favourite with us, and is as easily managed as the green variety. The plant is readily increased by division."

HOME CORRESPONDENCE.

A SOUTH OF ENGLAND GARDEN IN WINTER.—Although we have had sufficient frost to shrivel our Arums, Pelargoniums, and less hardy Fuchsias, as well as two Musa ensete (Madagascar Banana), which, early in December, were over 4 feet high from seed planted last February, the following list of plants, at present flowering in the open air, shows the exceptional nature of our climate: Acacia dealbata, 20 to 25 feet high; A. species?, from Australia; Coronilla glauca, in great luxuriance, and C. viminalis; Genistas, Diplopappus chrysophylla, Desfontainea spinosa, for past few months; Pimeleas, Pittosporum Tobira, for past two months; Arbutus, Abutilon megapotamicum, for past six months; Abutilon (Crusader), for past six months; Madras Citron, Clematis balearica, Veronica elliptica, V. Andersoni, Fragaria indica, Corchorus japonicus, Pyrus japonica, Cyclamen ibericum, C. Coum, and C. persicum; Erica carnea and E. mediterranea; Iris stylosa, for the past month; Hepatica, Tussilago fragrans, Duchesse d'Angoulême Pear-tree, Yellow Jasmine, Monthly Roses, Crocus Imperati, for past month; Crocuses, yellow, white, purple, &c.; Snowdrops, for past two weeks; Narcissus nana, Primroses, since November; Polyanthus, Violets, Helleborus niger, H. colchicus, and H. hybridus; Primula obconica, Olearia Gunnii, Berberis Darwinii, for some months, and B. aquifolia; Wallflowers, Triteleia uniflora, Iberis Pruiti, Rhododendron Nobleanum, Arabis grandiflora, and A. alpina; Scilla præcox, Aconite (Winter), Eranthis hyemalis, Anemones, Periwinkle, Senecio petasites, and Tritoma uvaria. The Benthamia fragifera is laden with its masses of Strawberry fruit, and Aralia Sieboldi is 6 feet high in seed. In Lord Kimberley's garden, opposite the manor office, the following are in flower: Azara microphylla, Prunus Pissardi, Saxifraga crassifolia, Yucca gloriosa, Tritoma Burchelli, Aucuba himalayica. The Madras Citron and Abutilons are the only plants on a wall. *Howard Fox, Rosehill, Falmouth, February* 1, 1893.

CAUSE OF GOOD FLAVOUR IN GROS COLMAR.—During the years from 1881 to 1889 experiments in the way of inarching different varieties of Vines on to others, in order to test the influence of the stock, were carried out at the Gardens, Warwick Castle. Gros Colmar was worked on the Muscat of Alexandria, and grown under the usual treatment for Muscat Grapes. The fruit produced by this Vine was pronounced by Lord Warwick and others who partook of it to be greatly improved, the flavour much better than the same variety when it is grown in early or late vineries. The same opinion was expressed by several gardeners and by two Fellows of the Royal Horticultural Society, both members of committees, who used to visit the gardens at the Castle several times a year, and who were interested in these experiments, and had tasted the Grapes for at least three years in succession. I cannot say that the

finish of the bunches or the depth of bloom was so good as when Gros Colmar is grown in a late vinery and on its own roots, but in the size of the berries, firmness of pulp, and in good keeping qualities, it exceeded the produce from own root Vines. My own experience is, that to bring this Grape to perfection it must have a long season of growth, and be treated like a Muscat. *C. D. A.*

—— Your correspondent, "Vagabond," on p. 111 of the *Gardeners' Chronicle*, asks for other gardeners' opinions on the cause of good flavour in Gros Colmar. My experience in the culture of the Gros Colmar Vine is, that if good flavour is desired it should be grown in a Muscat-house, or in a house where Muscat temperature is maintained. Grown by me in a garden in Monmouthshire, in a span-roofed Muscat vinery, the flavour of Gros Colmar was rich and excellent, in fact, not like the flavour of Gros Colmar at all when grown in a cooler temperature, which flavour, I consider, is then hardly second-rate before March, unless grown in a higher temperature than 65° at night. In span-roofed or Muscat vineries, I recommend a slight shade for Gros Colmar during very hot weather, which helps to prolong the freshness of the leaves, the shade being by preference of thin tiffany, which can be put on and taken off as occasion requires. This is better than a permanent shade. When I say that my then employers would eat only Madresfield Court, Muscat of Alexandria, Mrs. Pince, and Lady Downes' in a general way, the flavour of Gros Colmar grown in a Muscat-house (with a temperature never below 70° until ripe) was so good that they would not refuse to partake of this variety. *John Chinnery.*

—— Very interesting must this subject be to gardeners, yet the bearings of the case are of great importance to those who have to place fine Grapes on their employer's table. The fact of this variety being produced, and also exhibited in such large quantities in the leading fruiterers' shops, is the cause of an increased inquiry for it, and this will cause much difficulty to the gardener who must grow it in the ordinary mixed vinery, and prudently takes but a light crop from the canes of this variety; better err on the side of a short weight of fruit than over-crop. Last year was an exceptional year for flavour in this, the best of all market Grapes, and admitting the fact that we have to ignore the question of flavour as growers for the market, but only let the grower have a few dozen shops to supply direct with Grapes, he will find then that the matter of flavour will be of great importance. I am going to consider flavour apart from colour, the two being quite distinct. The chief factor in obtaining high flavour in Grapes is high cultivation, which too often is carried on at the expense of colour in the fruit, and there is no denying the fact that the best finished—i.e., sloe-black berries—are those that cannot be enjoyed when eaten. Then, by way of contrast, the paler bunches, equalling those in size of berries, are of superior quality as regards flavour, and this, too early in the season. There is much that perplexes me in the distinct characteristics of bunches of Grapes — the blacker the berries, and superior in appearance, the lighter the crop, and usually lacking in rich flavour. On the other hand, the paler-coloured fruits, borne in great numbers on the Vines, are very luscious, providing they are sound, and not shanking. The Gros Colmar Grape grown at a comparatively low temperature, cropped lightly, will be all that is desired in appearance, but when tasted it will be objectionable, and the flavour that of the Ivy. High cultivation, as I have said, being required to produce this variety, excellent in appearance and flavour, warmth must constitute an important factor

Fig. 25.—Carex japonica variegata. (see p. 172.)

in its cultivation. Root nutriment will also be another, and here it is that the high value of chemical manures is soon discovered. Whilst not despising the good qualities of farmyard manure, I should be sorry to depend on it alone, in fact, I could not produce the greatest weight of crop in the time allowed. Calling to mind Vines just cleared of their crop, some single roots planted at 3 feet apart, and carrying crops up to half-hundredweight each this season, yet with laterals and main rod wood stronger than that of the preceding years, is sufficient proof to me that heavy as was the crop, the Vines will bear a repetition of it. Grafting, inarching, or any form of uniting one variety on another is to be commended, as, without doubt, the flavour of Gros Colmar can be improved by the good quality of the stock on which it is worked. The large market growers of Grapes do not work so much in this line as they might do. The pressure of labour, large quantities that have to be grown, and the easy means of clearing off a crop, that is, selling it as soon as ready, do not offer great inducement for trying experiments. Let me say that any variety of Vine, however old, if it be worked with other varieties, will have new life imparted to it. The Muscat of Alexandria is a most promising stock for Gros Colmar, the flavour acquired being a decided advantage. Moreover, it increases the vigour and the cropping powers of the scion. Black Hamburgh is another good and trustworthy stock. Lady Downes' seedling, while adding to the flavour of a variety, when used as the stock, is lacking in size of bunch and berry, especially after a few years. Barbarossa (Gros Guillaume) is a fine stock, and bunches of Gros Colmar come very large upon it, yet at times the berry is wanting in size. Madresfield Court never yet afforded me such good results as a stock that I expected from it. So far as my experience goes, I am inclined to suppose that most varieties of the Vine used as a stock would improve Gros Colmar. But the operator should look further than mere slight improvements, he should strive for higher flavour, and the Muscat alone will give that. This year I shall work about twenty Muscat of Alexandria, which are planted alternately with canes of Gros Colmar: this presenting a ready mode of inarching when the laterals are of sufficient length to touch each other, and large enough to be properly manipulated. Inarching will not affect the crop carried by the Vines; and if it should be expedient to retain the old Vines, this can be done; although in this case, the young canes will not become quite so strong as would otherwise be the case, yet strong enough to make a good rod. Another and certain method is, to have a Vine in a pot of the desired variety, and if lateral, can be left long enough at pruning time. The union of the two may be made in February or March. Then there are other methods of Vine-grafting or inarching, each and all of which have their merits, but whichever is employed, it must be decided upon before the winter-pruning is done, on account of leaving laterals to be worked. *Stephen Castle, Fordingbridge.*

FREESIAS.—These beautiful winter and spring flowering bulbous plants are not grown so extensively as they deserve to be, seeing that they are of easy culture, and that the spikes of white and primrose-coloured flowers, which they produce with great freedom are deliciously scented. I grow about 1000 corms in 3-inch pots, placing seven of the small corms in each pot, filled with a compost consisting of about three-parts light sandy loam, and one of sweet leaf-mould; a few small crocks and a handful of half-rotted leaves being placed in the bottom for drainage. The pots are then placed on sifted coal-ashes in a dry situation, and, like those containing Hyacinths, Tulips, &c., they are covered with ashes to the thickness of about 3 inches. As soon as the plants have made about half an inch of growth, they are removed to a cool frame and shaded heavily at first, afterwards gradually inuring them to light and a little air. After this, small batches are introduced to a heated pit, placing the plants near to the glass to insure a sturdy growth; and to assist in this and the consequent production of stout flower-spikes, waterings of tepid diluted liquid-manure are given alternately with clear water. Plants thus treated have been doing us good service since Christmas, and are admirably adapted for furnishing purposes; the arching spikes of from nine to thirteen flowers hanging gracefully over the edge of stands, tables, and baskets, having a very pretty effect. The individual flowers are also very suitable for making button-holes, sprays, and bouquets, as they wire well, are the right colour, and are very fragrant. The variety, F. Leightlini major, is a new seedling of robust and branching habit, and the primrose-coloured flowers are larger and sweeter than those of F. refracta alba. The majority of my plants of this variety have nine good spikes to each 3-inch pot. As the odour of liquid manure is objectionable in a conservatory or greenhouse frequented by one's employers, occasional surface-dressings of Bull's Plant Food should be given to the plants immediately before applying clear water at the roots, as some stimulating and sustaining food is necessary in order to obtain the best possible results from plants at a time when the strain on them is so very great. *H. W. Ward.*

EARLY POTATOS.—It is a great advantage to have the use of an early warm south border under a wall, which can be utilised for an early crop of Potatos. Gardeners who utilise their borders at the foot of the south walls in this way, and without harming the trees in any way, raise early crops of Potatos. The old Ashleaf, and selections from it, or such early new varieties as Ringleader, Guardian, and the like, may be planted as soon as it is safe to do so in February. The ground should be well forked over, and rendered light; a notch may be dug out 6 inches in depth, and the Potatos, uncut, placed at the bottom, about 1 foot apart in the line. On the Potatos should be put a layer of short dung, and the soil placed on the top of that. The dung placed upon the top of the tubers serves not only the purpose of protection from frost, but acts as a fertiliser also. It is by utilising their warm, sloping, sunny borders in this way, that the inhabitants of the village of Erlstoke, near to Devizes, are able to send the earliest of home-grown Potatos into the Bristol market. *R. D.*

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—I hope Mr. Thomas' urgent appeal on behalf of the above Institution in the *Gardeners' Chronicle* (see p. 112), will meet the eye of most fellow gardeners in these islands, and that all those who have not yet subscribed to this most deserving Institution will at once resolve to do so. Mr. Thomas' appeal is so clearly explained that I think little more need be added; but as I have taken an interest in the society for some years, I cannot let the occasion pass without noticing it. It is stated there are 30,000 gardeners, nurserymen, and others engaged in horticultural pursuits, and when we find from the account of the recent general meeting that the subscriptions only amount to £1397 13*s.* 6*d.*, one is struck with the smallness of the amount. I know that it is not every gardener who is able to spare a guinea a year—in fact, I have experienced the difficulty of so doing myself—but I feel sure there are many more who might become subscribers. To all of such I would say—join it at once. I hope the new clause in the rules will be the means of inducing many to become members who have hitherto kept aloof. I venture to suggest that if in after years, should they never need its assistance, they will not regret having contributed their share to benefit others less fortunate. The late respected secretary, in his oft-repeated appeals for support; also Mr. Thomas, in his urgent appeal, clearly showed that there is no existing society which gives so much in return for so little contributed; and the gardeners of the present day are under a debt of gratitude to all those who still work, and have worked so earnestly and contributed so liberally to build up the noble Institution for the sole benefit of gardeners. *Thos. Jones, Elvetham Gardens, Winchfield, Hants.*

GRAPE BARBAROSSA (Gros Guillaume, so-called).—This very fine-looking late Grape was, I believe, raised by Mr. Butcher, father of Mr. Butcher, nurseryman, Stratford-on-Avon, [Mr. Barron, in *Vines and Vine Culture*, says that it was "brought under notice" by Messrs. Butcher about thirty-five years ago. Ed.], but whether I am right or wrong as to the raiser, matters little, as my chief aim in writing this note is to ask your many practical readers who are growers of the true Barbarossa Grape if they think the, to my mind, so-called Gros Guillaume Grape is anything else but the true old Barbarossa under a new name. [The true variety has red or grizzled berries. Ed.] For my part I could never see any difference, but I see in the *Garden Annual for* 1893 that the late Mr. Roberts, of Charleville Forest Gardens is acknowledged as the raiser of an improved variety of Gros Guillaume. All who ever saw the above Grape as grown by the late Mr. Roberts must admit that they were noble examples of the true Barbarossa, and for size, finish, and weight, not often seen; but as to its being a new variety, I could never see any difference except in name, but if any of my fellow readers of the *Gardeners' Chronicle* are able to inform me as to what Grape Barbarossa was raised from, also from what Grape the late Mr. Roberts raised his "improved variety," I shall be much obliged. Of all varieties of Grapes, Barbarossa is the most variable and fastidious on certain soils, and under some methods of cultivation; and many persons have asked me to describe the difference between Barbarossa and Gros Guillaume, and my only answer is that there is no difference so far as I can make out. Then say they, why is it called by two names? *W. C. Leach, Albury Park Gardens, Guildford.*

RED-SPIDER AND ITS REMEDIES.—The remedies recommended in your columns from time to time must prove interesting to all gardeners. For my own part, I should like to see some correspondence on that dreaded pest, red-spider, as affecting Peach trees in houses. I am well aware that in gardens where Peaches are done well, red-spider is not to be found, whilst Peach-houses in some gardens are greatly infested with it, in spite of winter dressings, copious syringings, and, in my case, even after coating the leaves with sulphur. Here, red-spider increases and multiplies to an alarming extent, and my experience goes to prove that severe winter-dressing is a risky proceeding, and as in many cases the forcing-house is used for other purposes, it seems to point to the fact that a good syringing solution is the thing really wanted. Will some of the readers of this journal give their experience? *C. W. C.*

ARUM PALÆSTINUM.—It may not be amiss to point out to your readers that this plant, referred to in a recent issue with a wood engraving, is offered by some continental firms under the name of A. sanctum. At any rate, roots purchased two years since under that name have proved to be the same as that figured by you. *Verbum sap. Senex.*

CHELTENHAM GREEN-TOPPED BEETROOT.—This is a most excellent variety to sow in the beginning of the month of May for main crop or other. In flavour and goodness of colour it leaves nothing to be desired. *H. Markham.*

BRITISH APPLES. — Reading your article on American and British Apples in the *Gardeners' Chronicle* of February 4, I offer the suggestion that growers of English Apples would do well to advertise the fruits they have for sale, as by this means private consumers would learn, and would be glad to know, where bushels of such Apples could be bought. Dealers in plants and flowers do advertise, why should not growers of fruit do likewise, and so get in contact with the producers? *H. W. Langston, M.D.*

DAFFODILS AT THE ANTIPODES. — Most of these, according to the *Rural Australian*, are now "down," that is to say, the grass has died back; it is therefore the time to lift the bulbs where desirable. We say this advisedly, as it is not always desirable. Where the ground is fairly well drained, and the bulbs have not been so long planted as to have increased, so as to impoverish one another, they may fairly stand for two or even three years; but where the contrary is the case, or where there are signs of disease, then the bulbs had better be lifted. To me this statement seems to be strange reading, as the bloom on my buds is a month earlier than last year, and more forward than many former years, so far as my recollection goes; Ard-Righ, Henry Irving, and many others having been in full bloom and beauty out-of-doors since February 1. *Wm. Baylor Hartland, Ard-Cairn, Cork.*

TREATMENT OF GOLD-FISH. — Referring to "D.'s" note on the above subject, in this week's issue, it may interest many of your readers to know that so far from running water, or even frequent change being necessary, the fish will thrive without practically any change of water at all. I have had two fish in an inverted bell-glass of about 14-inch diameter for some years, and my motto is to leave the water severely alone, the only change being made annually, when the spring cleaning involves temporary shifting. Once the water was not changed for five years, though, of course, in so long a period the loss by evaporation had occasionally to be made up. The glass stands on a sideboard away from the light; a couple of inches of clean sand and well-washed gravel occupy the bottom, and in this is inserted a few projecting branches of coral, bearing a large oyster or clam shell. Occa-

sionally a few pieces of the common water-weeds, including Watercress, are planted, but these usually are gradually nibbled away by the fish. Owing to the absence of strong light, the confervoid growth on the glass is small, and is occasionally removed by means of a small sponge attached to a stick. A circular sheet of glass raised a quarter of an inch from edge of bell, by means of leaden clips, prevents the dust from entering, without excluding the air entirely. The fish are fed several times a week with small shreds of cooked meat, and frequently evince their knowledge of dinner-time by their restlessness when the cloth is laid. The water is generally beautifully bright and clear, but now and then epidemics of animalcular life invade its purity, and form at once food for the fishes, and splendid material for microscopic investigation. To sum up, my experience in this direction teaches me that any arrangements for water-circulation or frequent changes are simply trouble thrown away, the latter especially doing more harm than good by disturbing and frightening the fish to their frequent damage. *Chas. T. Druery.*

THE FOG LINE.—Will Mr. D. T. Fish be so good as to follow up his interesting article on p. 100 by telling us how the dreaded fog line may be determined in any given site? Is there any more expeditious method than that of watching the fogs? *Will Tayler.*

THE ORPHAN FUND ELECTION.—A few interesting facts concerning the recent election of orphans on to this fund are worthy of notice. Because of the considerable efforts put forth in various directions on behalf of candidates, a heavy poll was looked for. That anticipation was fully realised, for the aggregate doubled the return of last year. The total votes, not necessarily papers, were 2787, and it is worthy of note the heaviest vote was cast for the new candidates; these, six in number, secured 1479 votes, and the nine second-year applicants 1308. No wonder, therefore, that five out of the six new applicants were elected, whilst of votes recorded on the 3rd inst., the sixth ran the three of the latter list elected very hard for place, and should easily secure election next year. It is, however, very probable that the old added votes to candidates of the second year's application proved to them a source somewhat of weakness, as it inspired too much confidence on the part of their supporters, especially when it is remembered that 90 votes or thereabouts sufficed to secure an election last year. It has now become very obvious that in this matter, not only may numbers of votes recorded be expected to increase yearly, but also that only very considerable exertions on the part of candidates' friends will win elections. There are still several non-elected orphans with whom it is not possible to feel other than sympathy, and it would not be any discredit to the fund if the committee were enabled to offer them some small assistance during the year, as five out of the seven unplaced seem to be deserving cases. Did, as Mr. Marshall remarked at the meeting, the gardeners of the kingdom but do their duty towards the fund, the whole of the applicants might have been elected. It was a matter for regret that the only child nominated from Scotland wanted only eleven more votes to have won. It would be very unfortunate did our northern friends assume that in regard to this annual election it is a case of "kissing going by favour," as one who succeeded in securing an election for a very deserving case, that of the child Stevens. I can say that only hard work and constant pegging away wins. Messrs. Crump, Bates, Tegg, and others who also scored successes, can tell the same tale. If the Scottish nominators are weak in votes, let them strengthen their position by getting many new ones from the north; and then they may always count on having a stout backing when occasion demands. In many cases no promises will be made by subscribers, and it is only when the votes are counted that results are ascertained. I know that even Mr. Crump, although his nominee was so far ahead, was to the last moment full of uncertainty. That fact will show that until the votes are counted no one can tell what the result will be. Generally, I think it will be admitted that the most distressing cases have been benefited, and others should be made absolutely safe next year. In the meantime let gardeners, especially, see that before the next election, they very much more largely have a voice in it. If everyone who exhibits for prizes would resolve annually to set apart for the Orphan Fund but 5 per cent. of his gains, the result would be a magnificent addition to the fund, and would give relief to the aching hearts of many poor gardeners' widows and orphans. *A. D.* [We believe the present voting system to be cumbersome and often unjust, in that the friendless ones, who ought to have the better chance, are placed in a worse position than those who have many friends. Subject to the approval of the subscribers, the committee should select the most deserving cases, and save much of the trouble and expense of voting as at present practised. Ed.]

SOCIETIES.

THE GARDENERS' ORPHAN FUND.

February 3.—The annual meeting of subscribers, and the election of children to the benefits of the Fund, took place at the Cannon Street Hotel on the above date, Dr. Maxwell T. Masters, F.R.S., one of the Vice-Presidents, in the chair; but the attendance of others than the committee was very small; probably the hour of meeting (2 p.m.) is somewhat inconvenient to many. The notice convening the meeting, and the minutes of the last annual gathering being read and signed, the report of the committee was submitted as follows:—

The executive committee have great pleasure in presenting their fifth report, and in congratulating the subscribers to the Gardeners' Orphan Fund on the closing of another successful financial year, and the continued prosperity of the charity.

The claims of the Fund having been brought under the notice of Her Royal Highness the Princess of Wales, the committee have the honour to announce that Her Royal Highness has been graciously pleased to become patroness of the Fund, and has expressed the hope that "the fact of her name appearing as patroness may assist the objects of the charity." Such exalted patronage being extended to the Fund is most gratifying to the committee, and will be of the greatest value and importance in the promotion and furtherance of the cause.

The munificent donation of £500 from Mr. and Mrs. Harry J. Veitch, as a thankoffering on the celebration of their silver wedding, was an act of generosity unexampled in the history of gardening charities, and the warmest thanks of all concerned in the welfare of the Fund are due to them.

The committee are under deep obligation to Sir James Whitehead, Bart., M.P., for his great kindness in presiding at the annual dinner at the Hôtel Métropole (which was a new departure in the management of the Fund), and whose eloquent appeal for support resulted in the sum of nearly £1000 being received on that occasion. The committee hereby tender him a most cordial vote of thanks.

During the past year, fifty children have been receiving the benefits of the Fund, and the committee recommend that eight be elected this day, bringing the roll up to fifty-eight. Two of the orphans on the list, viz., Victor Spyers and Ralph Joseph Gardiner, having attained the age of fourteen years, are no longer chargeable to the Fund. See Rule XIII.

The committee again take advantage of the presentation of their annual report to tender their most sincere thanks to the many kind friends throughout the country for efficient help rendered in many ways, but whose names it would be invidious to mention.

A slight falling off occurs in the annual subscriptions, which is to be regretted, as this should form the chief source of income. The committee appeal strongly for increased efforts in obtaining new subscribers and more earnest support from the gardening community generally, in whose interests the Fund was established and is maintained.

The committee have to lament the death during the year of Mr. C. H. Sharman, one of their most zealous and active colleagues, who took a very warm interest in the Fund from its commencement. The committee have elected Mr. Robert Ballantyne, as a member of their body, in the place rendered vacant by the death of Mr. Sharman.

The members of the committee who retire by rotation are Messrs. Head, Laing, Nicholson, Pourotation are Messrs. Head, Laing, Nicholson, Pourpart, Smith, Walker, and Turner, who, being eligible, offer themselves for re-election. The retiring auditor, Mr. John Fraser; the treasurer, Mr. T. B. Haywood; and the hon. secretary, Mr. A. F. Barron, are nominated by the committee for re-election.

(Signed) John Fraser, Leyton,
Wm. Sharp, Chartered Accountant, 60, Gresham Steet, E.C. } Auditors.

Dated, January 13, 1893.

In proposing the adoption of the report and financial statement, the chairman apologised in the first place for the unavoidable absence of Sir Julian Goldsmid, the president, and said that there were one or two points calling for comment. The first was the small attendance on that occasion, which might perhaps be taken as indicating the subscribers at large were perfectly satisfied with the way the business of the Fund is conducted. Another point is the importance to be attached to the announcement that H.R.H. the Princess of Wales had consented to become the patroness of the Fund. That the association of Her Royal Highness's name with the Fund will be the means of greatly benefiting it there can be no doubt. Then there is the special donation made by Mr. and Mrs. H. J. Veitch, which was a subject for great congratulation. There were fifty children enjoying the benefits of the Fund, but he (the chairman) thought that were the Fund supported by the gardening community as it deserved to be, the number would be 250. He regretted to notice a slight falling off in the amount of the annual subscriptions, but he had no doubt the committee would take steps to cover that deficiency; but he could not help saying it was not creditable to the gardeners of the country that such a paragraph should appear in the report. In supporting the motion, Mr. William Marshall said the financial statement was decidedly congratulatory, and the only weak point was that of the falling away of the annual subscriptions; and it was a matter of surprise to him that the general body of gardeners did not take more interest in a fund intended for their special benefit. If each gardener could be induced to subscribe weekly a few pennies, the gain to the Fund would be immense. The annual dinner proved a great success, and fully justified the outlay. The committee had during the past year invested just over £2000, and they had now considerably over £6000 value of Stock, which he thought highly satisfactory. The motion was then put and carried. Mr. Harry Turner proposed, and Mr. John Wills seconded, the

re-election of the treasurer, Mr. T. B. Haywood: carried. Mr. A. W. G. Weeks proposed, and Mr. B. Wynne seconded, the re-election of Mr. John Fraser as auditor: Mr. A. Outram proposed the re-election of the retiring members of the committee, Messrs. Head, Laing, Nicholson, Poupart, Smith, Walker, and Turner, which was seconded by Mr. A. J. Brown, of Chertsey, who complained that though many gardeners took large sums of money from exhibitions, yet they did not subscribe to the Fund, and he regretted to state that only one or two in his district supported it. If they would take the trouble to inquire into the cases of children receiving allowances, and candidates for it, they would then understand what a good work is being done by means of the Fund, and be led to support it. The motion was carried.

The Chairman proposed the re-election of Mr. A. F. Barron as Secretary, remarking that he commanded the confidence of the gardening community, and was pre-eminently the man to fill the office of secretary. Mr. Marshall, in seconding the motion, said that, as Chairman of the committee, he had been associated with Mr. Barron for two years, and he felt he could not say too much in praise of the manner in which he discharged his duties as Secretary; he was necessary to the Fund, and it would be very difficult indeed to replace him. On the motion of Mr. John Wright, seconded by Mr. G. W. Cummins, the names of Sir James Whitehead, Bart, M.P., and Sir Edwin Saunders, President of the National Chrysanthemum Society, were added to the list of Vice-Presidents. On the motion of Mr. William Marshall, seconded by Mr. H. Turner, Messrs. R. Dean, W. Poupart, A. W. G. Weeks, and B. Wynne were appointed scrutineers of the ballot. The meeting was adjourned until 4 P.M., when Mr. William Marshall was Chairman, and the scrutineers reported the result of the election, as follows:—

	Votes.
FREDERICK PRICE	445
NELLIE EDGE	254
ADA BEDDOES	228
JOHN MITCHELL	227
EMILY KATE NEVE	220
OTTO KOSBAB	217
PHILIP ARTHUR STEVENS	216
MINNIE ROPLEY	195
ROBERT HOUSTON	185
R. C. BLAKE	154
ROSA E. K. WARD	143
JOHN TITLEY	114
ALICE M. MILNE...	81
WINIFRED H. DOHERTY	59
JOHN KEATES	52

The chairman declared the first eight named duly elected upon the Fund. Votes of thanks were passed to the scrutineers, and to Dr. Masters and Mr. William Marshall for presiding, which votes brought the proceedings to a close.

FLORISTS' FLOWERS.

HOLLYHOCKS.

IF stock plants have been properly treated, cuttings should be attainable from now onwards. If these plants are put into a forcing-house at rest, merely protecting them from frosts, they do very well. Formerly I used to recommend root-grafting as a means of rapid propagation, and the method has advantages, the plants seeming to be a little more forward than those raised from cuttings; but as roots cannot always be obtained, and cuttings when well-cared for, seldom fail to make good plants, I now prefer the cuttings. Hollyhock cuttings want a rather brisk bottom-heat, say 85°, within one foot of the top, or in the plunging material, and it should be more rather than less. For the cutting-pots, I like to use what we term "long Toms," and these are filled with loam, leaf-mould, and sand in about an equal ratio, and in moderately moist condition; many of the cuttings being destroyed before roots form, if it became necessary to water them. The bed may consist of loam or leaves and stable-dung, with a layer of a few inches of cocoa-fibre refuse placed on the top in which to plunge the cutting-pots. A small frame should be placed over them. The cuttings, with heels attached, form roots in two or three weeks after insertion.

TREE CARNATIONS.

These are still in flower, and most of the plants are throwing out side-growths freely. These must be slipped off from the axils of the leaves, at least, as many of them as are required for cuttings. A dozen of them may be planted in a 5-inch flower-pot. Our cuttings are taken in the first three months of the year. They require identical treatment with the Hollyhocks, but the rooting process is more rapid. As soon as Carnation-cuttings are well rooted, place them on a shelf near the roof for a few days, potting them off singly in about ten days. See that the leaves are clean, as greenfly is sure to have attacked them whilst in the hot-bed. They must not be kept long in the warm house, but should be gradually inured to a light and airy position in the greenhouse.

AURICULAS.

Our plants were put into the Auricula-house towards the end of last month, and although few specimens of green-fly, which were on the plants, must have been exposed to 24° of frost for some time previously, the insects began to move very soon after the plants were put in the house. The wood-work and glass of the Auricula-house were washed before the plants were put into it. The latter will now not be exposed to frost, and as most of them were dust dry at the roots, they had to be watered two or three times before the whole of the soil was moistened. They are now started to grow, slowly at first, but steadily, and without check. The glass must not be allowed to sink below 40° after growth commences, for should the yet unexpanded flower-buds be exposed to a sharp frost, they ofttimes become what the fanciers term "set," and do not open out quite flat, as they should do. Avoid also the exposure of them to cold draughts, and if a keen frost-wind is blowing, admit the air on that side of the house that faces the opposite direction. It is well in fine weather to expose the plants freely to light and air. The small seedling Auriculas are now being pricked off; they are so very small, when the first leaf is formed, that a dozen of them can be pricked off into a 60-pot. The alpines in pots, are hardier than show Auriculas, and are not injured when merely protected by a glass roof, which should be screened from frosts at night by means of mats put over the glass, if the flower trusses are grown near it. Alpine varieties should not be freely watered at the present time, for if sharp frost sets in, and the soil should become frozen, much harm may occur. The alpine varieties succeed admirably when planted in good soil, that is kept rather moist in the summer, and when well placed in masses, they have a pleasing effect in the borders. *J. Douglas.*

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E. 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending February 4, is furnished from the Meteorological Office:—

"The *weather* continued mild in all parts of the kingdom, with generally cloudy skies, and frequent, but not heavy, falls of rain.

"The *temperature* exceeded the mean in all districts, the excess ranging from 3° in 'England, E. and N.E.,' to 4° or 5° in most other districts; and to 6° in the 'Midland Counties.' The highest of the maxima were recorded on somewhat irregular dates, and ranged from 55° in the more southern and western parts of England, to 53° in some of the northern and north-eastern districts, and the Channel Islands. The lowest of the minima were registered on January 29 at most of the English stations, and on later dates in Ireland and Scotland; they ranged from 27° in the 'Midland Counties,' to 35° in 'England, S.W.,' and to 40° in the 'Channel Islands.'

"The *rainfall* was rather more than the mean in 'Ireland,' 'England, E. and N.E.,' the 'Midland Counties,' and 'England, N.W.,' and just equal to it in 'England, S.;' elsewhere the fall was a little less than the normal amount.

"The *bright sunshine* did not differ materially from the mean, being slightly in excess in some districts, and a little deficient in others. The percentage of the possible duration ranged from 25 in 'England, S.W.,' to 12 in 'England, E.'"

TRADE NOTICE.

"PEARSON'S GARDENERS' DIRECTORY."

MR. THOMAS PEARSON, of Manchester, states, in a letter before us, that his firm does not publish any such book, and that no one is authorised by them to receive subscriptions. Gardeners are therefore cautioned not to listen to the solicitations of self-appointed canvassers nor to part with their shillings for any such prospective directory.

MARKETS.

COVENT GARDEN, February 9.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

STEADY trade doing. Prices as last week. *James Webber, Wholesale Apple Market.*

Orchid-bloom in variety not in quantity.

SEEDS.

London: *Feb.* 8.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that a good wholesale business in seeds is now in progress. The comparatively small supplies of American Clover seed held in England and in Europe generally are being further reduced by reshipments to the United States. Unless the Sound soon opens, and allows the Baltic seed (which is aboard several steamers still frozen up) to reach this country, London will very soon be extremely short of Clover seed. Alsike, White, and Trefoil are steady. French and Italian Rye-grasses are firm. Spring Tares on the spot, being very scarce, are dearer. For Peas the demand continues slow. Haricot Beans show an improving tendency. Canary seed is strong. Rapeseed points upwards. Linseed keeps steady. Windsor Beans are much inquired for.

FRUITS AND VEGETABLES.

Spitalfields: *Feb.* 7.—There was no change recorded in the prices of last week.

Borough, *Feb.* 7.—Quotations:—Savoys, 3*s.* to 5*s.* per tally; Brussels Sprouts, 1*s.* 6*d.* to 1*s.* 9*d.* per half-sieve; Turnip-tops, 3*s.* to 4*s.* per bag; Broccoli, 1*s.* 9*d.* per bushel; Greens, 1*s.* to 1*s.* 3*d.*; Parsley, 3*s.*; Carrots, 1*s.* 9*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 8*s.* per cwt.; Dutch do., 6*s.* per bag; Horseradish, 2*s.* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

Stratford, *Feb.* 8.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Savoys, 2*s.* to 6*s.* per tally; Greens, 1*s.* to 2*s.* 6*d.* per bag; do., 2*s.* to 3*s.* per dozen bunches; Cauliflowers, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen; do., 7*s.* to 10*s.* tally; Turnips, 35*s.* to 50*s.* per ton; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle-feeding, 20*s.* to 34*s.* per ton; Parsnips, 6*d.* to 1*s.* per score; Mangels, 17*s.* to 20*s.* per ton; Swedes, 20*s.* to 22*s.* per ton; Onions, English, 190*s.* to 200*s.* per ton; do., Dutch, 7*s.* to 7*s.* 6*d.* per bag; Bordeaux, 7*s.* to 7*s.* 6*d.* per case; Apples, English, 2*s.* to 6*s.* per bushel; do., American, 12*s.* to 20*s.* per barrel; Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; do., 2*s.* to 3*s.* 6*d.* flat; Scotch Kale, 9*d.* to 1*s.* 3*d.* per sieve; Turnip-tops, 3*s.* to 4*s.* per bag.

Farringdon: *Feb.* 9.—Quotations:—English Onions, £9 to £10 per ton; Belgian, do., 7*s.* 6*d.* per cwt.; Carrots, 50*s.* to 60*s.* per ton; Turnips, 45*s.* to 50*s.* do.; Sprouts, 1*s.* to 1*s.* 3*d.* per half-sieve; Seakale, 1*s.* 6*d.* per bushel; Horseradish, 2*s.* 6*d.* per bunch; Apples, American Baldwins, 14*s.* to 17*s.* 6*d.* per barrel; Pine-apples, 2*s.* 6*d.* to 3*s.* 6*d.* each; Spanish Onions, 7*s.* 6*d.* per case; Valencia do., 1*s.* 6*d.* do.

POTATOS.

Spitalfields: *Feb.* 7.—There are no changes to record in the prices obtained last week.

Borough: *Feb.* 7.—Quotations:—English Magnums, 50*s.* to 60*s.*; Hebrons, 60*s.*; Snowdrops, 60*s.* to 70*s.* per ton.

Stratford: *Feb.* 8.—Quotations:—Magnums, 50*s.* to 65*s.*; Bruce, do, 55*s.* to 75*s.*; Imperators, 50*s.* to 70*s.*; Scotch Magnums, 60*s.* to 70*s.*; Main Crop, 80*s.* to 105*s.* per ton.

Farringdon, *Feb.* 9.—Quotations:—Main Crop, 90*s.* to 100*s.*; Magnums, 65*s.* to 75*s.*; Bruces, do., 70*s.* to 80*s.* per ton.

London Averages: *Feb.* 8.—Quotations:—Magnums, 50*s.* to 70*s.*; Hebrons, 60*s.* to 75*s.*; Snowdrops, 60*s.* to 80*s.*; Imperators, 60*s.* to 70*s.*; Belgians, 55*s.* to 65*s.* per ton.

HAY.

Averages.—The following is the average of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 114*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 75*s.* to 112*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 28*s.* to 44*s.* per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending February 4, and for the corresponding period last year:—1893: Wheat, 26*s.* 5*d.*; Barley, 25*s.* 4*d.*; Oats, 17*s.* 5*d.* 1892: Wheat, 33*s.* 1*d.*; Barley, 28*s.* 7*d.*; Oats, 20*s.* 2*d.*

Answers to Correspondents

To our Readers.—*The Editor begs leave to solicit from the readers and contributors to the Gardeners' Chronicle:—*

Short Practical Notes on Cultural Matters;

Early Intelligence of Local News likely to be of general interest;

Notes and Memoranda useful to the Trade;

Specimens of New or Interesting Plants, Fruits, &c.;

Drawings or Photographs of Gardens, Trees, Flowers, &c., and which if suitable for reproduction will be utilised so far as possible.

Black Currants and Honeydew: *D. T. F.* The honeydew is a sweet sticky fluid voided by Aphis ribis, which lives on the undersides of the leaves, puncturing them, and causing them to assume a crippled appearance, with reddish pustules on the upper surface. The affected leaves should be plucked and burnt as soon as observed. Early washings with a mixture of tobacco-water or Quassia-water and soft soap would be a defence against this insect, and their use, even after bushes have become infested, would have good results.

Cocos Weddeliana Flowering: *G. W. R.* Very unusual in this country.

Cuttings: *Thirty Years' Reader.* The cuttings sent are those, apparently, of an Erica, of which the herbaceous species will strike now. The hard-wooded ones striking best in summer.

Diseased Apple and Pear: *R. N.* The "canker" in Apple is the result of the attack of a fungus the (Nectria ditissima), which is apparent in one place in the shape of small crimson knobs. For a full account, see *Gardeners' Chronicle*, April 19, 1884. The Pear seems to have been injured by frost or by particles of ice collecting in the angles of the branches, and then thawing by direct sun-heat. Fuller examination might reveal other causes.

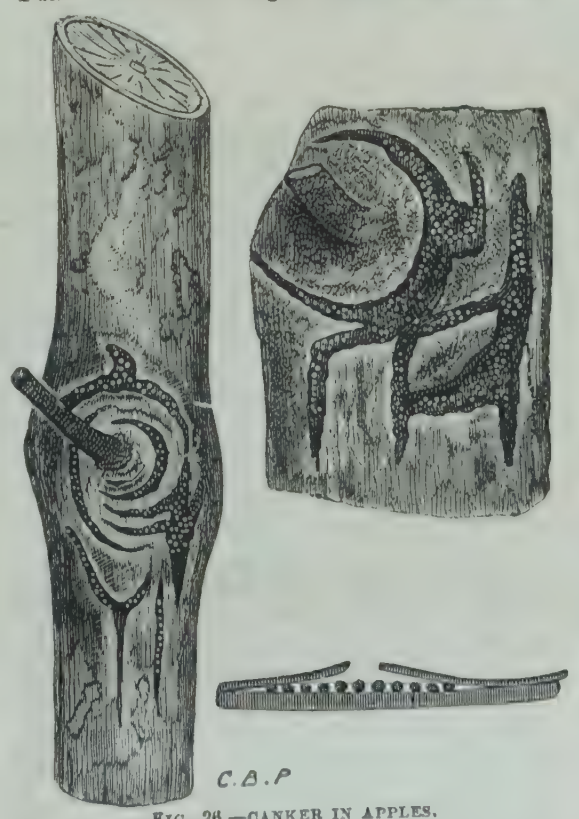

Fig. 26.—Canker in Apples.

Flow of Sap, &c.: *S. A. T.* In the bark the pith forms a store-house of food whilst the stem or shoot is young, but when these become woody, the pith has no further use.

Indoor Mushroom Culture on a Large Scale: *An American Lady.* The best, and largest probably, in these islands, is that carried on in the disused railway tunnel in Edinburgh.

Insects: *C. W.* The eggs are those of the winter moth (Cheimatobia brumata). Scrub the places where they are deposited with a hard brush and a solution of soft-soap or petroleum emulsion. If grease bandages had been applied to the trees near the earth at the end of autumn, they would have averted the progress of the female moths, and averted the deposition of eggs. *R. McL.*

Fig. 27.—Cheimatobia brumata: winter moth. Winged male, and wingless female.

"Kew" Thermometer Screen: *W. S. Tillett.* We do not know what the exact cost is, but it would probably be less than a pound.

Names of Fruits: *E. Roberts.* You should have sent earlier in the season, they are too far past for identification.

Names of Plants: *G. T. Shaw.* Narcissus Telamonius plenus. Common double Daffodil.—*C. W.* Omitted in our last issue. Probably a variety of Cytisus proliferus. *L.—J. B.* It is impossible to name with certainty small twigs of Conifers without their cones. If the trees grew in Wellington Street with their names attached, we could compare the specimens; as it is, we fall back on dried specimens, which are not satisfactory. This is the best we can do:—1, perhaps Picea ajanensis; 2, ?; 3, looks like Picea excelsa var. finedonensis; 4, possibly Picea rubra; 5, ?; 6, looks like a form of Picea excelsa; 7, Pinus strobus (Weymouth); 8, P. silvestris var., Scotch Pine; 9, P. silvestris var.; 10, perhaps Pinus contorta; 11, P. Laricio var. pyrenaica.—*D. T. F.* Sea Buckthorn, Hippophae Rhamnoides.—*M. I.* 1, Apparently the common Silver Fir, Abies pectinata; 2, the Fulham Oak; 3, Thuya orientalis var.; 4, Smilax aspera; 5, Gaultheria Shallon; 6, Probably some Juniper, not wild in Australia; 7, Vanda Strangeana.—*S. G.* 1, Asplenium bulbiferum; 2, A. biforme; 3, Pteris tremula; 4, Adiantum capillus-veneris var.; 5, Polygala Dalmaisiana; 6, Manettia bicolor.—*G. S.* Probably Anthericum lineare variegata. Send flowers with fresh leaves. —*G. Sayers.* Cattleya Walkeriana.—*T. W.* 1, Crassula Cotyledon; 2, not found; 3, Pteris serrulata; 4, Selaginella Kraussiana; 5, Sedum rupestre.

New Code for Government Schools: *Constant Reader.* Queen's Printers, Messrs. Eyre & Spottiswood.

Red-spider on Gooseberry and Currant Bushes: *D. T. F.* Spraying or syringing with flowers-of-sulphur intimately mixed with water, and daily syringing of the bushes in the evening during the early summer months, would keep them clean. We should suppose that the ground on which the bushes are growing is dry and light, therefore copious root-waterings would aid in checking the multiplication of the insects.

Stockbridge Celery Fertiliser: *J. A.* The article, being of American manufacture, may not be obtainable in this country. You might apply to the Rural Publishing Co., New York, U.S.A.

Weed in Lawn: *C. C.* Afford dressings of nitrate of soda, sulphate of ammonia, or stable dung, to cause the Grass to grow quickly and strongly, and thus smother the weed, Cerastium sps.

Weed-killers: *Prunella.* Mostly liquid, and of poisonous nature. They would injure any living tissue. Weed-killer may be used at any season—using a pointed piece of wood and merely letting a drop of the liquid fall on the heart of the plant.

And 10 GUINEA CUP.

The Gardens, The Priory, Hornsey, December 3, 1892.

SIRS,—You will, I am sure, have noticed my extraordinary success this season, having taken no less than 39 **Prizes, of which 28 were Firsts.**

The Shows at which I exhibited included the **Royal Aquarium, open to all England; the Kent Show at Blackheath; and the Highgate Show, at which, in addition, I secured the Ten-Guinea Cup, having won it two years in succession.**

I have used your Manures now for some years, and can testify to their sterling worth. I should be sorry to be without "Le Fruitier" and "Liquid Manure Powder," for I know their value both for Vine and Chrysanthemum culture.

I think it only right to say that I attribute no small portion of my success to the use of your Manures generally.

(Signed) Yours truly, EDWIN ROWBOTTOM.

Messrs. Wm. Wood & Son.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are :—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s.

(*The larger sizes are very strong for carriage drives.*)

HOLLOWAY'S PILLS.—Dismiss your doubts.—Let no one be longer oppressed with the notion that his malady is incurable till these purifying Pills have had a fair trial. When ordinary preparations have failed, these Pills have been used with the most marked success. A course of this admirable medicine clears the blood from all impurities, and improves its quality. The whole system is thus benefited through the usual channels without reduction of strength, shock to the nerves, or any other inconvenience; in fact, health is renewed by natural means. For curing diseases of the throat, windpipe, and chest, these Pills have pre-eminently established a world-wide fame, and in complaints of the stomach, liver, and kidneys, they are equally efficacious. They are composed of rare balsams, without a single grain of mercury or any other deleterious substance.

MESSRS. PROTHEROE AND MORRIS beg to draw attention to the above, included in their LILY SALE on WEDNESDAY NEXT, February 22.

Friday Next.

GRAND IMPORTATIONS.

The rare and handsome free-blooming, easily-grown

ONCIDIUM JONESIANUM.

CATTLEYA SP. (?) or SCHRODERÆ TYPE,

With Onion-like pseudobulbs, quite unlike any other species of Cattleya; it looks like a hybrid between a round-bulbed species and C. labiata; spikes are of enormous thickness, with numerous flower-seats. It comes from the Kayman River Territory, interior of U.S. Colombia, towards Bolivia, and if it is not a form of C. Schroderæ, then it is certainly a new Cattleya. We had not the least thought of finding this Cattleya in the neighbourhood where Cattleya Rex grows, and which we hope soon to offer. One plant opened in the case, and the sepals and petals were snow-white, the lip also, and the centre of the flower deep chrome-yellow; the flower is of perfect form and shape, and it reminded us of Cattleya Schroderæ, and it may be a form of this, the finest of all spring-flowering Cattleyas. The plants are simply marvellous, and we guarantee it is a grand Cattleya.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. SANDER, St. Albans, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 24, at half-past 12 o'Clock precisely—

A MAGNIFICENT IMPORTATION OF

ONCIDIUM JONESIANUM.

ONCIDIUM JONESIANUM is, without doubt, one of the most valuable introductions. Its large and elegant white crimson-spotted and golden-yellow blossoms are borne in profusion on many branched spikes, each inflorescence frequently carrying as many as twenty-four to thirty flowers. As hardly two varieties are alike, nothing can be more beautiful and attractive than a group of these lovely plants. When grown on blocks near the glass, they thrive and blossom freely.

ONCIDIUM JONESIANUM IS NOW VERY RARE.

ONCIDIUM JONESIANUM has not been imported for many years, and Buyers should seize the present opportunity to acquire a stock of plants of this most exquisite Oncidium, which will grow freely, and flower abundantly.

A superb importation of

CATTLEYA SP. (?), OR SCHRODERÆ TYPE,

With bulbs of enormous size, and curiously striking and distinct appearance. Found by one of our oldest and most experienced collectors in a quite untrodden region, and gathered under exceptional difficulties and dangers, as well as at great cost. The whole importation is offered, and we guarantee it is a grand Cattleya.

PLANTS ARE IN SPLENDID ORDER.

ODONTOGLOSSUM PESCATOREI.

A splendid importation; bulbs sound and healthy, diverse and distinct in appearance, and doubtless rich in exceptional varieties.

CYPRIPEDIUM INSIGNE VAR. MONTANUM.

A small but healthy importation of OUR WELL-KNOWN and justly renowned type.

DENDROBIUM NOBILE, from the Chinese Frontier.

The grandest and most beautiful varieties ever seen have appeared from this source. Some imported plants, now flowering, were shown at the ROYAL HORTICULTURAL SOCIETY'S meeting on Tuesday last, and the distinct features in the varieties exhibited were the admiration of all present.

LÆLIA WENDLANDIANA (?), or probably a variety of

L. AUTUMNALIS ATRORUBENS.

Bulbs very exceptional; leaves broad, short and thick. Our man found it growing on the high mountains of Western Mexico with Schomburgkia Sanderiana.

CYPRIPEDIUM LINDLEYANUM.

An extremely rare and valuable species; strong, healthy plants.

Also a fine lot of PHAIUS, from the same country that produced Sanderianus.

ADA AURANTIACA, ODONTOGLOSSUM PHALÆNOPSIS,
ANGULOA CLOWESII " SP., like NEBULOSUM,
CALANTHE OCULATA GIGANTEA, &c.

On view morning of Sale, and Catalogues had.

Wednesday Next.

500 Choice named Standard, Dwarf, and Climbing ROSES, from one of the first English Growers, including many of the newest sorts; 300 lots of BORDER PLANTS, collection of FRUIT TREES, HARDY ORNAMENTAL FLOWERING TREES and SHRUBS, EVERGREENS, LILIUMS from Japan, Chinese and European PÆONIES, Choice NARCISSUS, DAHLIAS, BEGONIAS, GLADIOLI, DUTCH BULBS, ANEMONES, 1000 SPIRÆA JAPONICA, LILY OF THE VALLEY, GARDEN BARROWS, NETTING, &c.

MR. J. C. STEVENS will SELL the above by AUCTION at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, February 22, at half-past 12 o'Clock precisely.

On view morning of Sale, and Catalogues had.

Thursday Next.

A fine Importation of LILIUMS from Japan, comprising 5000 LILIUM AURATUM and Others from Japan, choice Home-grown LILIUMS, 10,000 LILY OF THE VALLEY Crowns, &c.

MR. J. C. STEVENS' will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, February 23.

On view morning of Sale, and Catalogues had.

Thursday Next.

VALUABLE IMPORTED AND ESTABLISHED ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, February 23, at half-past 12 o'Clock precisely, a good COLLECTION of ESTABLISHED ORCHIDS, chiefly in Flower and Bud, including some fine specimens and varieties, to which will be added an importation of ORCHIDS from Messrs. F. Horsman & Co., comprising Odontoglossums, Cattleyas, Lælia purpurata, &c., in splendid order, &c.

On view morning of Sale, and Catalogues had.

Edgbaston, Birmingham.

MR. THOMAS B. JAMES will SELL by AUCTION, without reserve, by order of Messrs. Hewitt & Co., on WEDNESDAY, March 1, at 11 o'Clock A.M., the whole of their COLLECTION of PALMS and DECORATIVE PLANTS at the Royal Nurseries, Harborne Road, Birmingham, including 600 Palms in variety, several grand specimens 12 feet high; 300 Dracænas, 300 Aralias, 3000 Isolepis, large numbers of Aspidistras, Myrtles, Agaves, Ferns, Epiphyllums, Hoyas, Ophiopogons, Amaryllis, Pernettias, Thyrsocanthus, Streptocarpus, Camellias, Maréchal Niel and other pot Roses, Clematis, Ivies, Cyclamen, Pelargoniums, and various other things.

Catalogues of Messrs. HEWITT AND CO., Solihull and Birmingham; and of the Auctioneer, 12, Bull Ring, Birmingham.

WANTED to RENT or PURCHASE, a Detached COTTAGE, with Large GARDEN; or Small NURSERY, within easy distance of a town, on main road.
Mr. McGREGOR, Paganhill, Stroud, Gloucester.

TO LET, a Small NURSERY.—Apply to E. BLAND, Primrose Nursery, Fordham, Cambs.

TO LET IMMEDIATELY, for MARKET GARDENING, about ¾ Acre, Glasshouses, &c. Richmond, 9 miles from London.—For particulars, apply to—
HARVEY, 44, Ararat Road, Richmond.

Priory Nursery, Acton Lane, Middlesex.

TO BE LET, part of remaining Grounds, in portions, or as a whole (nearly 3 acres), having about Eighteen large Greenhouses, in good working order, near to four railway stations, and London Markets. An uncommon opportunity to Tomato and Cucumber Growers, &c.

Apply, on the Premises, or of Mr. HORSNAIL, 96, Newgate Street, City, London.

EXCELLENT SITE for NURSERY!!—Eight-roomed House, Coach-house, Stable, and Shed, with about 3½ acres of rich Garden Land (Freehold), in the favourite neighbourhood of Hampton, for Sale, on exceedingly favourable terms; or would be Leased.

Apply Mr. F. G. HUGHES, The Estate Office, Hampton-on-Thames.

TO LET, Immediately, through ill health, a genuine SEED, PLANT, and FLORIST'S BUSINESS, in growing market town, near London, main thoroughfare. Thorough investigation. Good opportunity for pushing man.—H. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Cheltenham.

To MARKET GARDENERS, FRUIT GROWERS, and OTHERS.

TO LET, from March 25 next, an important MARKET GARDEN, extending over 11 Acres, of the soil of which is some of the richest in the County, and is well stocked with choice Fruit Trees. A good House goes with the Property, together with Vineries, Greenhouses, Peach-house, Store-rooms, Stabling, Piggeries, &c., all conveniently placed. The whole may be acquired at a valuation, or a PARTNERSHIP with the present occupier arranged.

Further information of S. B. VARDER, Estate Agent, Valuer, and Auctioneer, Albion Chambers, Clarence Parade, Cheltenham.

To Nurserymen, Fruit Growers, and Florists.

TO BE LET, The BULSTRODE LOWER GARDENS, situate near Gerrard's Cross, 5 miles from Slough, and 20 miles by excellent road to London, consisting of 12½ acres of good Garden Land, walled all round, and well stocked with choice Fruit Trees, various Glass-houses, with good Furnaces, Vinery, Peach-house, Mushroom-house, &c. Extensive Plantation of Nut Trees. Excellent Water Supply. Capital 9-roomed Dwelling House, useful Outbuildings; also 4-roomed Cottage, &c. Maximum rental (covering rates, tithe, &c.), £95 per annum.

Apply to Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, E.C.; or to Mr. W. C. HERON, Auctioneer, Uxbridge, Middlesex.

BATH.—TO BE SOLD, Seven MODERN GREENHOUSES, Heated by Hot-Water Piping, either in One or Separate Lots.

Particulars, price, and orders to View of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

TO BE SOLD, by Private Treaty, the WHITTINGTON ROAD MARKET GARDEN PROPERTY, with excellent Greenhouses, all in good working order, and good Dwelling House.—For particulars, apply to—
WILLIAMS AND NICHOLSON, Salop House, Oswestry.

NURSERY FOR SALE, near Blackheath, S.E., in Working Order.—Land, 442 feet by 150 feet (more or less), at low ground rent; contains seven Glasshouses, about 100 feet to 123 feet long, heated by three boilers. Three cold Frames, about 100 feet long; Planting Ground, &c. Stock at valuation if desired. Apply to—
THOMAS PEACOCK, Warwick Square, London, E.C.

KENT.—A very attractive and modern NURSERY, of 3½ Acres, with ten Span-roof Greenhouses, each 130 feet long; two Vineries, nearly 400 feet; and large Peach-house, the whole heated by 4-inch hot-water Piping, together with two Sheds and Pits. Vineries planted with Vines, and the Greenhouses contain the usual Greenhouse Stock. Price, £1500. Open to an offer. Stock optional.

Particulars of Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, London, E.C.

To Florists and Fruit Growers.

TO BE SOLD, owing to ill-health of the Proprietor, a FLORIST'S SHOP in West End. Also capital Fruit Garden, with Vineries and Glass-houses, in good working order. Capital required, about £700.

Particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

FEBRUARY 14, 1893.

TO MESSRS. SUTTON AND SONS,
SEEDSMEN, READING.

GENTLEMEN,—We regret that we have INFRINGED YOUR COPYRIGHT in a certain Illustration of a Residence, Tennis Lawn, and Garden, and beg to offer you our APOLOGY for having done so. We desire to state that the infringement was quite unintentional on our part, as we obtained the electro from a firm who had, we believed, the right to supply it, and we used this electro in perfect ignorance that the illustration was your Copyright. We thank you for your consideration in not taking legal proceedings against us, and we undertake not to repeat the infringement of this or any other illustration of yours. We further authorise you to publish this letter, and shall be pleased to pay any reasonable expense you have been put to in the matter.—Yours truly,

ARMITAGE AND IBBETSON,

Bradford, Yorks.

To Gardeners, Nurserymen, &c.

THE CORPORATION of LEEDS invite TENDERS for Four or Five Thousand FOREST TREES, SHRUBS, &c. For particulars apply at City Engineer's Office. Tenders to be in by 9 o'clock, A.M., on February 22.

London County Council.

TO FLOWER-POT MANUFACTURERS and OTHERS.

TENDERS are invited for the SUPPLY of FLOWER-POTS, SEED-PANS, &c., required at the Parks and Gardens under the control of the Council for one year from the date of acceptance of tender. Persons desirous of submitting tenders may obtain a copy of the specification, form of tender, and instructions for tendering on application to the Chief Officer, Parks Sub-Department, at the County Hall, Spring Gardens, S.W.

The contractor will be bound by the contract to pay to all workmen employed by him the rates of wages and to observe the hours of labour recognised at the date of the tender as fair by the several Trades Unions of the district in which the work is to be done, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

The tenders, which must be on the form supplied by the Council, are to be addressed to "The Clerk of the Council," and endorsed "Tender for Flower-pots," and must be delivered at this Office before 10 o'clock, A.M., on February 24, 1893, and no tender will be received after that hour. Any tender which is not in accordance with the instructions for tendering will be rejected.

The Council does not bind itself to accept the lowest or any tender.

H. DE LA HOOKE, Clerk of the Council.

Spring Gardens, S.W., February 10, 1893.

WHEELER'S
NEW POTATO,
"THE ALDERMAN."

For Exhibition this Potato is a model—the eyes are shallow, the skin rough; it is of large size, a great cropper, and of the finest possible quality; it withstands disease well, and is one of the most profitable Potatos to grow.

Price 4/- per peck; 12/6 per bushel.

"I am specially pleased with 'THE ALDERMAN' Potato, and consider it one of the most valuable introductions."—J. H. FRY.

"From the 3 lb. ALDERMAN POTATOS I raised 93 lb. grand tubers, many weighing from 1 lb. to 1½ lb., and when cooked they are very white and floury, and for quality unsurpassed. This crop was grown in wet and poor soil, and not one diseased in the crop."—E. CRUMP.

Upwards of a hundred other testimonials, copy of which may be had gratis and post-free on application.

Testimonials.

"Shirburn Castle, January 5, 1890.

"SIR,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."

"Hornby Castle, Lancaster, February, 1890.

"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

UP TO DATE PEAS.

CARTERS' DAISY.

(THE MOST DELICIOUS FLAVOURED PEA.)

A new dwarf sweet-flavoured Marrowfat Pea.

A Fellow of the Royal Society who inspected our Crop of DAISY PEAS, says:—"Many have seen illustrations of rows of Pea-haulms propped up and supported by the ripening pods, and many have smiled sceptically at what they considered the playful imagination of the artist. A visit to Messrs. Carters' field of Daisy Peas suffice to show that had the artist been present at Bromley he would not have had to tax his imagination much. There were about three acres under growth in rows three feet apart, and throughout the crop was uniformly large"

Awarded two years in succession the highest honours of the Royal Horticultural Society after thorough trial.

Price in Sealed Packets, 3/- per ¼ pint; 5/- per ½ pint, post free.

VEGETABLE SEEDS—

BEET, Thomson's Superb Red.—Unsurpassed for garden and decorative purposes. Per oz., 1*s.* 6d.

BROCCOLI, Thomson's Self-protecting.—One of the hardiest Broccolis grown. Per Packet, 1*s.* 6*d.*

BROCCOLI, Snow's Winter White.—An extra select stock. Per Packet, 1*s.* 6*d.*

CARROT, Thomson's New Improved Horn.—Superior to the Horn Carrots now in cultivation. Per oz, 8*d.*

LEEK, Musselburgh.—True stock; Scotch saved. Per oz., 2*s.* 6*d.*

PARSLEY, Thomson's Superb Curled.—Dwarf and compact; beautifully curled. Per oz., 1*s.*

TOMATO, Thomson's Excelsior.—Undoubtedly one of the best for general use; smooth-skinned, and of fine flavour. Per Packet, 1*s.* 6*d.*

CATALOGUE of SELECT GARDEN SEEDS forwarded on application. All goods carriage paid.

THOMSON'S VINES. THOMSON'S STYPTIC.

THE CORINIUM GUINEA COLLECTION
OF HIGH-CLASS SEEDS

Is probably the cheapest and best assorted ever offered. It contains 12 pints best Peas for succession, 4 pints Broad Beans, 1½ pint French Beans, 3 ounces Carrot, 3 ounces Onion, 1 ounce Parsnip and Beet, Broccoli, Brussels Sprouts, Cabbage, Cauliflower, Celery, Cress, Cucumber, Leek, Lettuce, Mustard, Melon, Parsley, Radish, Spinach, Turnip, Tomato, Vegetable Marrow, Herbs, &c., &c., in sufficient quantities for a medium-sized Garden. Carriage and package free.

For Smaller Collections, see Vegetable and Flower Seeds Catalogue, free on application.

JNO. JEFFERIES & SON,
SEED MERCHANTS, CIRENCESTER.

PLANTING SEASON.
HARDILY-GROWN
FOREST, FRUIT,
& ALL OTHER
TREES & PLANTS,
EVERGREENS, ROSES, &c.
NURSERIES 400 ACRES:
VERY EXTENSIVE STOCK. Inspection Invited.
Priced Catalogues Gratis & Post Free.
DICKSONS (LIMITED) THE NURSERIES CHESTER.

ECKFORD'S NEW CULINARY PEAS,
"EPICURE and CENSOR."

Two varieties of great merit. Full marks in the R.H.S. trials. Well worth the attention of Exhibitors.

In sealed ½-pints, 2*s.* 6*d.*

DESCRIPTIVE CATALOGUES Post Free.

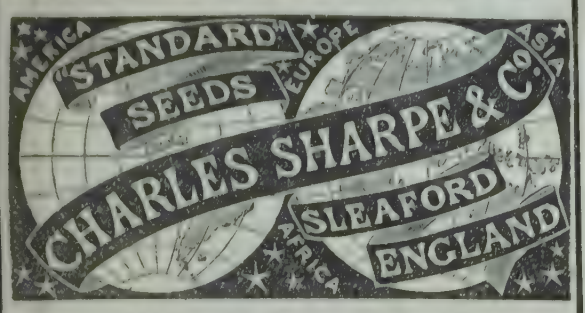
TWO GOOD THINGS.



THE BEST PEA IS

SHARPE'S QUEEN.

Best of all for { PRODUCTIVENESS. QUALITY. COLOUR. FLAVOUR.

The Finest Variety grown, either for Private or Market Gardening.

Price, 2s. per Quart.

THE BEST EARLY POTATO IS

SHARPE'S VICTOR.

Admitted by all to be the EARLIEST and BEST for Pot, Frame, or Border Culture. The flesh is of a beautiful CREAMY YELLOW, and in flavour it equals the old Ashtop. Price, 15s. per cwt.; 2s. per stone.

Carriage Paid on 1 cwt. and upwards. Trade prices on application.

CHARMING FLOWERS OF EASY CULTURE.

VEITCHS'

NEW HYBRID

Streptocarpus

Awards of Merit (for the Strain) Royal Hort. Society.
Four Certificates of Merit, Royal Botanic Society.

Should be Grown by All, either for Greenhouse, Conservatory, or Window Decoration.

"The Streptocarpus is unquestionably a charming flower, and one that we may reasonably expect to become quickly popular. It does not require a microscope to discover the virtues of this plant; they are patent to all, and consist in a delightful variety of colours, freedom, vigour, brightness, and easy culture. To enumerate any more good points is not necessary, and those who wish for long display of flowers over a season not too full of floral treasures, will find the Streptocarpus of unusual value."—*The Gardeners' Magazine, June* 6.

If seed is sown in February the plants come into bloom the following June and July, and continue flowering freely until the end of September and October. As pot plants they are highly decorative, and succeed wonderfully well when planted out along the borders of the walks in a greenhouse or conservatory.

Seed saved from the newest and brightest coloured hybrids, per packet, 2s. 6d.

For full descriptions of the above, and many other CHOICE NOVELTIES and SPECIALTIES, see SEED CATALOGUE for 1893, *forwarded gratis and post-free on application.*

Gardeners' Chronicle.

SATURDAY, FEBRUARY 18, 1893.

MOISTURE OF THE SOIL AND ITS EFFECT ON PLANT LIFE.

IT is sometimes extremely instructive to compare general results derived from study of living plants in the field with special conclusions obtained by experience in the laboratory. As a general rule the last method of inquiry leads into a wilderness of conflicting and contradictory statements, especially when the experiments have been conducted by independent observers; of course, a single set of experiments conducted by one person is (if it give any conclusion at all), more or less harmonious. Still, when one does find any double confirmation of this kind, the result is probably more valuable than any reasoning from either method alone; and in the following few facts, I have found such a double confirmation.

A series of very excellent papers has recently been published in Germany on the different capacities for retaining and conducting water shown by different soils, and these explain certain peculiar phenomena in plant life.

Thus, if one arranges a series of soils such as, sand of a quartzose character, loam, leaf-mould with a certain amount of lime and sand, pure leaf-mould, clay and peat, these will be found to vary as follows:—

The thicker or denser soils will be able to retain a larger amount of water than the loose and sandy ones, and this result holds true (Prof. Wollny, *Forschungen*, vol. v., p. 1) in the same kind of soil if the particles are closer together in one case than in the other. For instance, beating the soil in a pot, and pressing it closely down, makes it able to hold more water than if the earth is lightly poured in. The reason, of course, is, that the particles are so close to one another, that they form narrow capillary passages which retain the water in the same way as ordinary capillary tubes.

For a similar reason these thicker clayey soils do not thaw so quickly as the loose sandy ones, and in long-continued drought, the cracks formed by the sun are fewer in number (though deeper and narrower) than those produced in the looser sandy ground; in fact, all changes in temperature are felt more rapidly and severely in loose sandy soil than they are in thick clay or loam, which becomes more slowly heated and cooled, though retaining the heat for a longer period.

This explains a point which always greatly puzzled me in Egypt. Between Cairo and the Pyramids there is a stretch of flat ground, mostly pure alluvial of the Delta, but turning into the ordinary desert sand about half to a quarter of a mile before the low limestone hills on which the Pyramids are built. (Part of this forms the links of the Mena House Hotel.)

I noticed that when the soil was even very slightly clayey or alluvial, many small herbaceous

*

plants and a few perennials grew upon it; but when there was no sign of alluvial, scarcely a single plant grew there, and the few which did exist, were all the regular desert forms which seem to subsist chiefly upon dew. The line was so well marked that one could almost have drawn it upon the soil, and in view of the preceding experiments, the reason is quite obvious. These little herbaceous Thistles and Plantains could not live unless the soil retained a certain amount of water for them, and it was only the fine-grained alluvial particles which were able to do this.

Another point in field botany, which is particularly striking in my own district (Dumfriesshire), is the manner in which many plants which really belong to much warmer counties, establish themselves in what seem very unlikely places. Thus Linaria minor, the small Toadflax, Viola cornuta, the Goat's-Beard, Tragopogon pratensis, and other peculiar southern forms occur invariably on the dry cinders and slag or waste ground of railways; of course the seed is probably brought by rail, but while Linaria minor has extended over the whole Caledonian railway from Carlisle to Beattock summit, it has nowhere to my knowledge travelled a single yard to the right or left; and this is also the case with the other forms. Here, again, we may perhaps see how the irregular porous soil of the railway, being more easily and strongly heated by the sun, enables the plant to penetrate northwards far beyond its proper home.

Another point in English botany is the way in which fleshy-leaved plants, such as the Purslane, and certain other plants, as Eryngium campestre, Brassica monensis, and so on, which are our nearest approximations to the desert types of hot and arid countries, invariably appear on the seashore, where there ought to be more moisture than anywhere else. These plants, however, grow in sand and shingle, and this becomes more rapidly and strongly heated by the sun than other soils.

The reason of rolling our crops after sowing is pretty obvious also; the ground is compressed, and so both retains water for the seedling, and is less liable to severe changes of temperature.

These experiments also explain the extraordinary change produced by thoroughly draining wet or stiff soils. In such ground the water is apt to adhere too strongly, and so prevent the growth of anything except marsh plants, such as Rushes, or rank moisture-loving grasses. On draining (or aëration by digging, which has the same effect), the capillary tubes in the soil are broken up, and the water is continually drained away, thus affording ground for good meadow grass.

Another point brought out by Professor Wollny and Herr Eser in the same *Journal*, vols. vi. and vii., is the effect of plants on the temperature of the soil. Thus it was found, that ground which was covered by plants did not become either so hot in summer or so cold in winter as that which was left exposed, and the daily change in temperature was also much less than in bare ground. It was also found that ground covered with straw or manure was not so well protected against these changes as that covered with living grass, and that the closer and thicker the stems of grass or corn were planted, the better was the protection against changes of temperature. It seems probable, from other experiments, that these differences are due to the way in which evaporation from the soil is checked by living plants. The plant-covering acts as a sponge, and after a shower of rain retains a large amount of water, which is only given off gradually afterwards. This explains the familiar fact, that the disappearance of forests usually produces drought in hot climates, as instanced by the Cape de Verde Islands, which, when discovered by the Portuguese, were covered with forest and very fertile, and are now exceedingly barren and arid, and only possess a single tree. This, probably, also in part explains why ponds which are sheltered by trees do not freeze so quickly as those which are exposed—for instance, St. James's Park, as compared with the Round Pond.

There is also a peculiar reaction of surroundings on plants, and plants on their surroundings in this connection. A tropical forest, where there is great humidity of the air, is always extraordinarily full of plants and exceedingly dense. The trees are very close together, and there is an enormous amount of undergrowth, while the creepers fill up every available space between the undergrowth and the upper branches. This extreme density of the foliage is not nearly so marked on the tops of mountains, and sometimes disappears altogether on the crest of a mountain or a plateau, where the wind can sweep the moisture away. One sees exactly the same thing in this country; any very narrow valley or glen among the hills is, when left alone, much more crowded with vegetation than an exposed wood, and grass grows much more closely on stiff or wet ground than it does on light and loose soils.

One might multiply conclusions and hints of this kind indefinitely, but perhaps enough has been said to show the value of such laboratory experiments, which seem unfortunately to be made only in Germany, and not to have found an abiding place in our own country, where agriculture certainly requires the best scientific assistance. *G. F. Scott Elliott.*

New or Noteworthy Plants.

Odontoglossum crispum, Hunter's var.

Among the many varieties of this Protean-plant, the large flowering are more fashionable than the smaller ones, yet from time to time specimens come into flower of medium or even of small size which are of special attraction and merit, and which for their grace and loveliness may come into competition with the crowd of forms without a distinct character. Recently we received from H. T. Hunter, Esq., St. Andrews, Edinburgh, a flower of only 1¾ inches in diameter, with an unusually narrow lip, which will range amongst we will not say the best, but certainly the most valuable varieties that we have noticed for some long time past. The flower is mostly white, suffused with rosy-blush beneath the border of the sepals, and on the fringed border of the petals are numerous rosy blotches, and at the base of those leaflets is a group of several intense rosy-coloured spots. The lip is yellow at the disc, with a large rosy blotch between the crest and the top. If one would make a comparison between a big-flowering variety and a small one, it may be said that it is an O. crispum Trianæ much reduced in size, and with more intense colours. The rosy colour runs through the entire flower, and the way the flowers are arranged is similar to what is observed in the inflorescence of Phalænopsis Schilleriana. The variety "roseo-punctata," which was awarded a mark of merit by the Royal Horticultural Society, is the nearest approach to our new *débutant*. *F. Kränzlin, Berlin.*

Lælia Finckeniana, *new nat. hybrid.*

This pretty, distinct, natural hybrid Lælia first flowered with C. W. Fincken, Esq., Hoyland Hall, Barnsley, out of an importation of the Liverpool Horticultural Co., and a good plant of it has lately bloomed with Messrs. F. Sander & Co., of St. Albans. In growth the plant nearly resembles Lælia autumnalis alba, or a stout form of L. albida, but the leaves are broader. The flowers at first sight might be taken for a rather small L. anceps Sanderiana, but on examination the labellum is seen to be totally different, the ovate-oblong front lobe of the labellum being much larger, and the basal part and side lobes much shorter than in any form of L. anceps. The flowers are pure white, the base of the lip having some purple lines extending half-way up the side lobes, and three yellow-ridges running along the lower half of the middle lobe, the front of which has a bright purplish crescent-shaped colouring and a broad white margin. It might be L. autumnalis alba × L. anceps, white var., but the problem is a difficult one to solve. It should be said that in Messrs. Sander's plant the pseudo-bulbs exhibit the angles of L. anceps more than in Mr. Fincken's. *James O'Brien.*

Grafting Eucalyptus.—M. Justin Dugourd, in a recent number of the *Revue Horticole*, has an article on this subject. Eucalyptus globulus, which is the species generally preferred, whether for ornamental or sanitary purposes, does not succeed on dry, rocky soils, where E. resinifera succeeds well. It was very natural, therefore, to graft the globulus upon the resinifera, and this has been successfully accomplished both by cleft-grafting and by budding. Grafts thus effected in Palestine have attained the height of 2 mètres in five months.

Bismarck Apple.

We are enabled to lay before our readers a figure of this Apple as grown by Messrs. Bunyard, of Maidstone, who hold it in high esteem for its cropping properties. It is, indeed, well spoken of generally. Messrs. Bunyard say it is of Tasmanian origin, whilst Messrs. Rivers attribute it to New Zealand. It is a large Apple, globose-conic, rather depressed at the top, and with a short stalk. It is of brilliant colour, and, owing to its productiveness and good-keeping qualities, is one of the best Apples for market purposes. As to keeping qualities, they were evidenced in the fine sample shown on Tuesday last at the Royal Horticultural Society by Messrs. Cheal.

Orchid Notes and Gleanings.

Oncidium Saintlegerianum, *Rolfe.*

Mr. O'Brien, at p. 10, speaks of his suspicion that when Oncidium Saintlegerianum was described, the figure of O. spilotanthum, Lindl., *Bot. Reg.*, xxxi., t. 40, was overlooked. This is not the case, however. The two plants certainly resemble each other rather closely, so much so, that at the first cursory glance, I not only thought of this plant, but attempted to identify them together. Then, and not before, I saw that they belonged to quite different groups, for in O. Saintlegerianum the lateral sepals are united for a considerable distance, while in O. spilotanthum they are quite free. The affinity I indicated for the former is quite correct, and I have nothing to add thereto. It was Lindley who united O. spilotanthum with O. Batemannianum, and I believe not erroneously, though its flowers are a little larger. Both have free lateral sepals, and a number of small tubercles round the central crest, which characters are quite wanting in O. Saintlegerianum. Although I have not seen Mr. Lucas' plant, I suspect it belongs to this new species, which certainly does bear a superficial resemblance to O. spilotanthum. *R. A. Rolfe.*

A New Variety of Odontoglossum crispum.

We have received from Mr. William Kirkpatrick of Bogotá, Republic of Colombia (New Granada), a dried flower, with a full-sized drawing of plant, of a new variety. The petals are creamy-white, with a slight tinge of yellow, and spotted with orange-yellow; the lips are also yellow. We are informed that the plant remains in Bogotá until such time that it may be remitted in a flowering state. It looks as if it might be a hybrid in the way of O. Andersonianum, and in most importations there come forms very like the one in question.

Two New Hybrid Cypripediums.

C. Eucharis (*F. Desbois*).—A hybrid from C. insigne Chantini by C. Lawrenceanum. Dorsal sepal very fine, the centre clear yellow, speckled with brown, lightened with violet, and distinctly bordered with white; inferior sepal greenish-white, veined with clear green. Pendent petals reddish mahogany-brown, marked with two little ridges upon each petal. Lip reddish-crimson. Staminode amber, with light hieroglyphic markings, green in the centre. Foliage fine, ground-colour clear green, much mottled with dark blackish-green.

C. villosum violaceum, Hort.—A hybrid from C. villosum × hirsutissimum. Dorsal sepal dull black, fading into clear green, bordered with creamy-white; inferior sepal greenish-blue, lightly streaked with dark green. Petals bright chestnut-red above, much speckled with dark crimson, the lower part clear amber-yellow, slightly spotted towards the base. Staminode pinkish-flesh colour, surmounted with a large excrescence, sea-green in the centre. Foliage like that of C. hirsutissimum, but more elongated; slightly resembling C. Germinyanum. These two hybrids were raised by M. Ch. Vuylsteke, nurseryman, of Locchristy, near Ghent. *F. Desbois.*

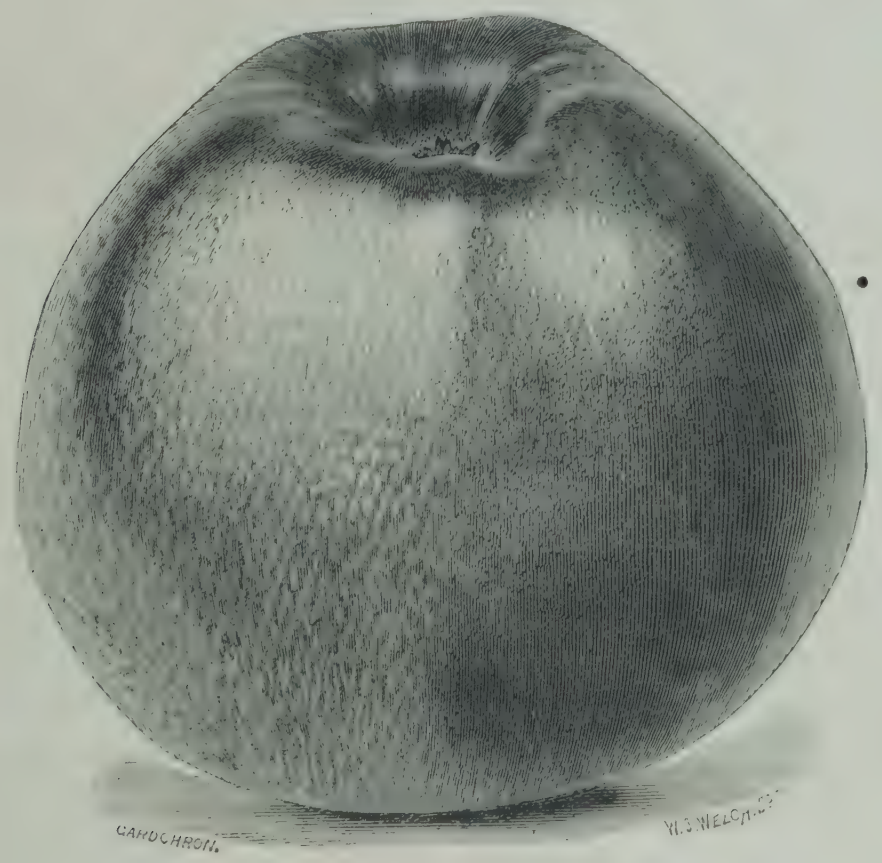

Fig. 28.—Bismarck apple. (see p. 194.)

EXPERIMENTS IN MANURING

POTATOS.

With a view of increasing the yield of our field Potatos last season, I tried several experiments with various manures. The soil of the field is a stiff loam, which contains a large quantity of small pieces of limestone, and a considerable amount of ironstone in pieces varying from quite small up to that of a man's fist. This upper layer is 8 inches deep on an average, and beneath it is another of limestone rock of varying thickness, and consisting of small lumps mixed with soil, which is almost as firm as concrete. The land slopes sharply to the north-west, and is thus well drained. A portion of this field is always cropped with Potatos, and the crop of tubers is of first-class quality. As a rule, they are usually planted to succeed Mangel Wurzel, the latter being manured with about 20 tons of good farmyard manure per acre, which is ploughed in before the seed is sown; and when the young Mangels are growing freely, they are afforded a dressing of chemical manure, consisting of superphosphate, nitrate of soda, bone-flour and muriate of potash. There is always a residue of this dressing left in the soil after the Mangel crop is taken away, which assists the Potatos the next season. All the Mangel tops are also left on the ground, and ploughed in, and this returns part of the nitrogen for the benefit of the succeeding crop. The ground is ploughed to a depth of 8 inches early in the autumn, so as to get the full benefit of the winter's frost, which liberates potash and other mineral substances in the soil, and also produces a good tilth.

Last season £75 worth of produce was sold from this field, and £35 worth used at home, which is an average produce of £17 per acre; and yet we are often told that it does not pay to cultivate land now.

Plot No. 1 was manured with gas-lime at the rate of 20 cart-loads per acre, as an experiment. Cost of the lime and its application = £2 12*s.* per acre.

	tns.	cwt.	qr.	lb.
Yield—Ware	5	6	2	22
Seed	2	2	1	18
Small	0	14	1	4

Value per acre, £23 6*s.* 8*d.*

Value per acre, less cost of manuring, £23 14*s.* 8*d.*

Plot No. 2 was manured with a mixture composed of two parts kainit, 1 part nitrate of soda, 1 part superphosphate, and 1 part steamed bone-flour; 3½ cwt. of this was used per acre, at a cost, including application = £1 5*s.* 9d.

	tns.	cwt.	qr.	lb.
Yield—Ware	7	15	3	22
Seed	2	1	2	18
Small	0	19	2	6

Value per acre, £36 17*s.* 4*d.*

Value per acre, less cost of manuring, £35 11*s.* 7*d.*

Plot No. 3 had mineral manures the same as No. 2, and in addition had 10 cart-loads of gas-lime and 10 cart-loads of coal-ashes per acre. Cost of manure and its application = £3 17*s.* 9*d.*

	tns.	cwt.	qr.	lb.
Yield—Ware	8	5	1	25
Seed	1	15	0	13
Small	0	16	2	18

Value per acre, £37 11*s.* 4*d.*

Value per acre, less cost of manuring, £33 13*s.* 7*d.*

Plot No. 4 was cropped with Potatos last season, and this spring was manured with farmyard-dung at the rate of 20 cart-loads per acre. Cost of manure and its application = £5 18*s.* 6*d.*

	tns.	cwt.	qr.	lb.
Yield—Ware	7	9	0	12
Seed	2	14	1	24
Small	1	9	3	18

Value per acre £37 2*s.* 8*d.*

Value per acre, less cost of manuring, £31 4*s.* 2*d.*

Plot No. 5 had no manure this season, but was cropped with Mangels last year, when it had 20 cart-loads of farmyard dung, and 6 cwt. mineral manure per acre. The latter cost £3, and was composed of nitrate of soda, muriate of potash, steamed bone-flour, and superphosphate.

	tns.	cwt.	qr.	lb.
Yield—Ware	9	18	0	24
Seed	1	16	0	18
Small	1	10	3	6

Value per acre £45 4*s.*

Plot No. 6.—The previous season this plot had the same manure as No. 5, and this year was dressed previous to planting with 3½ cwt. per acre of mineral manure of the same mixture as No. 2. Cost of manure and its application = £1 5*s.* 3*d.*

	tns.	cwt.	qr.	lb.
Yield—Ware	10	6	1	0
Seed	1	15	3	21
Small	1	0	3	1

Value per acre £46 0*s.* 8*d.*

Value per acre, less cost of manuring, £44 15*s.* 5*d.*

Plots Nos. 1, 2, 3, and 4 were cropped with Potatos the previous season, and had no residue of mineral manure in the soil like Nos. 5 and 6.

Plot No. 2 gave the best returns where there was no residue of manure in the ground, and the sample was very good.

In plot No. 3 the ashes would probably have shown a better result without the gas-lime. The tubers came up much cleaner and brighter than on some of the other plots.

In plot No. 4 the gross proceeds show 5*s.* 4*d.* per acre better than No. 2 (where mineral manure was used), but farmyard-manure, no matter how good it may be, is too costly in its application, and does not pay so well in the end. Many of the tubers on this plot were also too large and proved to be hollow inside.

Plot No. 5 gave by far the best results—as the residue after last year's manuring for Mangels was amply sufficient, and nothing has to be deducted for cost of manure. The sample was a good one. A few only of the tubers were too large, but not enough to make any difference in the value of the crop; however, they showed plainly that plenty of plant food was supplied.

Plot No. 6 was, in every respect, treated the same as No. 5, with the exception of the dressing of manure given at planting time; the total weight of the crop was 2 cwt. less than No. 5, the gain in gross value resulting from the increase of the ware, the increased yield did not pay for application of the manure as the *net* returns were 8*s.* 7*d.* per acre less.

The variety grown was Magnum Bonum, which is always of good quality with me. I always save my own seed, as I do not believe in the tradition that a change of seed has a good influence on the crop. I have grown the same stock in this field for eight years, and instead of deteriorating I find the last crop has been one of the best we have ever had, but great care is always taken in storing the seed. I do not approve of the pitting system, and always have the sets spread out carefully on the floor of a loft where frost is barely excluded. When first dug the tubers often have to lay in a large heap for two months, but early in January there we have more space to spare, and the heap is then levelled down to about 1 foot in thickness, and so remains till planting time comes. By planting early in April the greater part of the first shoots are saved, and there is no waste of the nutriment stored up in the seed-tuber. Doubtless, our immunity from the Potato disease is partly owing to the exposed position of the field and to carefulness in gathering up the tops and the few diseased tubers, and destroying them immediately after storing the crop. As regards

cost of cultivation, which has not been deducted from the above trials, planting with the aid of a horse to draw the furrows, but covering in by hand, costs about 26*s.* per acre, and digging, sorting by hand, and storing the crop, costs about 83*s.* 9*d.* per acre on the heaviest portion. Other expenses, such as earthing and hoeing, are only trifling. *W. H. Divers, Ketton Hall Gardens, Stamford.*

A SYNOPSIS OF THE SPECIES OF CANNA.

(*Continued from p.* 164.)

17. Canna polyclada, Wawra, *Maxim. Reisc.*, 143, t. 122. Stem tall, slender, glabrous. Leaves oblong, with a rounded base, acute, deep green, with a claret-brown edge, the lower 1½ foot long. Inflorescence a panicle 1½ to 2 feet long, with long slender racemose branches; bracts suborbicular; flowers often in pairs. Sepals lanceolate, ½ inch long. Petals lanceolate, tinged with red, unequal, the longest 2 inches long. Upper staminodia two, oblanceolate, bright crimson, acute, not longer than the petals; lip oblanceolate, bright crimson, spotted on the claw with yellow. Capsule globose, 1 inch diameter.

Hab.—Southern and Central Brazil; Rio Janeiro to Matto Grosso.

18. C. speciosa, Rosc., *Scit.*, t. 17; *Bot. Mag.*, t. 2317; *Bot. Reg.*, t. 1276. *C. polymorpha* and *leptocheila*, Bouché. Stem green, glabrous, 5 to 6 feet long. Leaves green, broad, oblong, acute, the lowest 1½ to 2 feet long. Panicle deeply forked; racemes long. Sepals lanceolate, pale red, ¾ inch long. Petals lanceolate, pale red, 2 inches long. Upper staminodia usually two, bright red, emarginate, 3 inches long, ¼ to ⅓ inch broad; lip bright red-yellow, emarginate. Capsule larger than in *C. indica.*

Hab.—Eastern Himalayas; Nepaul, *Wallich.* Sikkim, drawn by Sir J. D. Hooker. Introduced into cultivation about 1819. *C. nepalensis*, of Wallich, is a form with three upper staminodia. I know nothing of *C. violacea*, Bouché, in *Linnæa*, xii., 146, of which the leaves are said to be deciduously woolly beneath, the flowers 4 inches long, and the three to four upper staminodia, like the lip, yellow and dull violet.

19. C. discolor, Lindl., in *Bot. Reg.*, t. 1231. Stem 6 to 10 feet long, stout, glabrous, purple, glaucous. Leaves broad, oblong, acute, more or less suffused with claret-brown, the lower reaching 3 feet long by nearly half as broad. Panicle deeply forked; racemes lax; bracts small, orbicular. Sepals lanceolate, green, ½ inch long. Petals lanceolate, pale green, 1½ inch long. Upper staminodia two, oblanceolate, bright red, entire, 2½ inches long, ¼ to ⅓ inch broad; lip brick-red, lanceolate, emarginate. Capsule larger than in *C. indica.*

Hab.—Tropical America. Introduced into Europe from the Botanic Garden at Trinidad about 1829. Specimens collected in Guatemala by Bernouilli and Captain Donnell Smith probably belong here.

Sub-genus II. Distemon. Corolla-tube short. Upper staminodia suppressed.

20. C. paniculata, Ruiz. and Pav., *Fl. Peruv.*, i., p. 1, t. 1 (excluding leaf). *C. denudata*, Rosc., *Scit.*, t. 22, 23. *C. excelsa*, Lodd., *Bot. Cab.*, t. 743. *C. divaricata*, Klotsch. Stems tall, slender, glabrous. Leaves green, oblong, acute, glabrous, the lower 1½ to 2 feet long, 6 to 8 inches broad. Inflorescence a large panicle, with several lax racemose branches; branch-bracts linear, scariose, reaching a length of 6 to 9 inches; flower-bracts small, very acute; flowers single, distinctly stalked. Sepals lanceolate, ½ inch long. Petals lanceolate, yellowish-green, 2 to 3 inches long. Upper staminodia entirely suppressed; lip and anther-bearing staminode linear, bright crimson, rather longer than the petals. Capsule small, oblong.

Hab.—South Brazil, *Burchell! Sello! Bowie and Cunningham!* Peru, *Pavon!* Bouché and Horaninow admit seven species of *Distemon*, but all our London specimens do not vary materially. The original description and figure of *C. paniculata* are both very poor, and the leaf in Pavon's type specimen in the British Museum, which coincides with his description, is evidently not that of a Canna. I have seen the Columbian form.

Sub-genus III. Eurystylus. Corolla-tube long. Upper staminodia three, unguiculate; lip orbicular.

21. C. flaccida, Salisb., *Stirp. Rar.*, t. 2; Red., *Lil.*, t. 107; Rosc., *Scit.*, t. 6; Lodd., *Bot. Cab.*, t. 562 (Dill., *Hort. Eltham.* t. 59, fig. 69). Stem green, glabrous, 4 to 5 feet long. Leaves oblong-lanceolate, green, the lower 1 to 1½ foot long, 4 to 5 inch broad. Inflorescence a lax few-flowered simple raceme; bracts very small. Sepals lanceolate, green, 1 inch long. Corolla-tube cylindrical, 2 to 2½ inches long; lobes lanceolate, reflexing, nearly as long as the tube. Upper staminodia three, their free part obovate-unguiculate, sulphur-yellow, 2½ to 3 inches long by above 1 inch broad; lip the same colour, large, orbicular. Capsule obovoid-oblong, 2 inch long.

Hab.—Southern United States; Carolina to Florida, in swamps. This is totally different from C. glauca, with which it was confused by Linnæus, Miller and Willdenow. *C. Reevesii*, Lindl., *Bot. Reg.*, t. 2004, is the same species described from specimens cultivated in China. It is in Edgeworth's collection from a garden in the Central Himalayas.

Sub-genus IV. Achiridia. Tube of the corolla and of the staminodia as long as the blade. Flowers very large, pendulous.

22. C. iridiflora, Ruiz. and Pav., *Fl. Peruv.*, i., 1; Rosc., *Scit.*, t. 14; *Bot. Reg.*, t. 609; *Bot. Mag.*, t. 1968. Stem green, 6 to 10 feet long. Leaves oblong, bright green, slightly pubescent beneath, the lower 2 to 2½ feet long by 1 foot broad. Inflorescence a panicle composed of several drooping corymbose racemes; branch-bracts large, scariose, boat-shaped; flower-bracts small, ovate or lanceolate. Sepals green, lanceolate, 1 inch long. Tube of the corolla cylindrical, 2½ inches long; lobes lanceolate, red-brown, as long as the tube. Upper staminodia three, rather longer than the corolla-lobes, rose-crimson, obovate-unguiculate, ¾ to 1 inch broad; lip the same colour, narrower, deeply emarginate.

Hab.—Andes of Peru, introduced into cultivation by Mr. A. B. Lambert in 1816.

23. C. liliiflora, Warscew.; Planch. in *Flore des Serres*, t. 1055-6; *Rev. Hort.*, 1884, p. 132, with figure. Stem robust, green, 8 to 10 feet long. Leaves many, oblong, green, the largest in the genus, 3 to 4 feet long, 1½ foot broad, spreading from the stem at a right angle. Inflorescence a panicle composed of several corymbose branches; rachis green, glabrous; branch-bracts large, linear-oblong, pale green. Sepals linear, as long as the tube of the corolla. Petals lanceolate, pale green, 5 to 6 inches long, united in the lower half in a cylindrical tube. Upper staminodia three, white, united in a tube in the lower half, with a spreading obovate-unguiculate blade ¾ to 1 inch broad; lip oblanceolate, as long as the staminodia. Flowers finally tinged with pale brown and scented.

Hab.—Veraguas, introduced into cultivation by Von Warscewicz about 1855. *J. G. Baker.*

FOREIGN CORRESPONDENCE.

ORCHIDS AT NORTH EASTON, MASS., U.S.A.

December 10, 1892.—Visitors to this noted collection at any season will always find something of interest in bloom among the many unique and beautifully-grown examples to be found here. Mr. F. L. Ames is an amateur in the true sense of the word, and is doing much to popularise Orchid culture, allowing the public free admission to the houses—a privilege which thousands take advantage of. It would be impossible to note in detail the numerous plants recently seen here. All the flowering Orchids, with the exception of the cooler-growing varieties, were arranged in the large Cattleya-house, forming a glowing display. Among the most conspicuous was a group of Dendrobium Phalænopsis Schroderianum, with upwards of 500 fully-expanded blossoms, possessing remarkable and pleasing variation; one specimen carried 100 flowers, on fifteen spikes. D. p. Statterianum was also in bloom: its flowers, though smaller, are of intensely rich colour; also a quantity of D. bigibbum. Plants of Cattleya in flower were suspended throughout the house, and included many remarkable and valuable hybrids. In flower was also observed the rare C. leucoglossa, with three of its delicate and pretty blooms; this is a hybrid between C. Fausta and C. Loddigesii. A plant of Lælio-Cattleya Pallas, the lip of which was intensely vivid, had two large flowers open; the parents of this variety being Lælia crispa and Cattleya Dowiana is sufficient to account for the great beauty of this plant—the petals, however, show the influence of L. crispa, as they partake much of its revolute character. Cattleya Cassandra, a cross between C. Loddigesii and Lælia elegans, had five flowers open, which are of a soft lilac colour, with a large C. Loddigesii lip, that is marked with amethyst. Well-bloomed was a specimen of Lælio-Cattleya Marriottiana, a lovely hybrid, with a novel colour. These, and numerous examples of Cattleya labiata, made quite a paradise of bloom, the latter in almost every case carrying four-flowered stems, and the colour, substance, and form were all that could be wished.

Lælia anceps, especially the white forms of it, have done well this season, and I remarked one specimen of L. a. Sanderiana with seventeen flower-spikes, several L. a Stella, with seven, eight, and ten each; L. a. Amesiana (a very delicate-coloured and rare form), L. a. Ballantineana, L. a. Schroderiana, L. a. Dawsonii, and L. a. Hilli, were in bud; and a forest of flower-spikes was noticed on a batch of the ordinary form. L. autumnalis alba had six spikes of its handsome snow-white blooms; L. Gouldiana, true, was well-flowered; a specimen of Cattleya Bowringeana had more then fifty flower-spikes—a wonderful sight. Among the Cymbidiums were a healthy specimen of C. elegans, carrying two immense flower-spikes; the pretty white and pink striped C. pulcherrimum, with four strong panicles; and a fine flowering plant of C. eburneo Lowianum was well advanced in bloom.

Cypripediums are well grown, and many of them matchless specimens. Among them were several distinct examples of C. H. Ballantine, obtained from seed raised in this collection. C. T. B. Haywood (a grand plant) had seven flowers; C. tessellatum porphyreum three fine blooms; the chaste C. insigne var. Sanderiæ, a very healthy plant, had two flowers C. MacFarlanei, C. astræa (a charming variety), C. Niobe, C. regale, and the pretty C. polystigmaticum a number of seedlings of great promise have found a home here.

In the house set apart for cool-flowering Orchids were many hybrid Odontoglots with bold massive spikes; a grand plant of O. hystrix illustris had fourteen flowers; Odontoglossum Wilckeanum var. Burfordiense carried six blooms, broad, and of great substance and colour. In a basket was a plant of the rare Miltonia Bluntii var. Lubbersiana, in flower; Miltonia Bleui var. splendens was just showing flower on three strong growths; and in a very moist cool corner of the house numerous Masdevallias were in flower, including several interesting and pretty hybrids, such as M. Courtauldiana, M. Measuresiana, M. Gairiana, M. Geleniana, and others; also a distinct variety raised here between M. ignea rubescens and M. Harryana—the flower is as large as the finest M. ignea, and possesses a pleasing suffusion of purple. Several more seedlings are shortly expected to bloom.

The crossing of Orchids receives great attention and the condition of these delicate treasures is as gratifying to the owner as to the gardener, Mr. Wm. Robinson, considering the very high summer-heat experienced in this part of the country. *A. D—k.*

CYNORCHIS.

This name is given to a genus of terrestrial tuberous-rooted Orchids of the Ophrydeous tribe, allied to Habenaria, but having the central lobe of the rostellum well developed. Bentham estimated the number of species at twelve, all natives of the Mascarene Islands and of tropical Africa, and Mr. Rolfe has added several others. C. grandiflora, of which we give an illustration (fig. 29), was shown on Tuesday last at the Royal Horticultural Society by Messrs. Lewis, of Southgate. Mr. Ridley, in the *Journal of the Linnean Society*, describes it as a

Fig. 29.—CYNORCHIS GRANDIFLORA: FLOWER-SEGMENTS, OBLONG, GREEN, SPOTTED WITH PURPLE LIP, BRIGHT ROSY-LILAC.

terrestrial herb, with oblong woolly tubers; sheathing leaves, the radical one spreading, lanceolate, 3 inches long; the cauline leaves sheathing round the stem, which is 4 to 5 inches high, with one or two large flowers. Sepals oblong lanceolate, green, red-spotted; petals narrower, white, lip broadly four-lobed, lateral lobes obovate, the central one dividing into two broad divisions; spur long, abruptly dilated at the apex; column very short, with slender curved stigmatic processes. Mr. Ridley enumerates two varieties:—

Var. α, purpurea, with the lip purple, spotted at the base, and scentless.

Var. β, albata, lip white, purple at the base, fragrant.
